APPLICATION

The Honeywell RM7890A,B,C/EC7890A,B Relay Modules are microprocessor based integrated burner controls for on/off automatically fired gas, oil, or combination fuel single burner applications. The RM/EC7890 Relay Module is intended to replace the RA890F,G, H Protectorelay® Primary Control. The RM/EC7890 System consists of a relay module, subbase, and amplifier. Options include: 2-line VFD (see document 65-0090) or 4-line LCD (see document 32-00110) Keyboard Display Module, and remote display mounting.

Functions the RM/EC7890 provides include automatic burner on/off sequencing, flame supervision, system status indication, system or self-diagnostics and troubleshooting.

This document provides installation and static checkout instructions. Other applicable publications are:

SPECIFICATIONS

Electrical Ratings (See Table 3):
Voltage and Frequency:
RM7890: 120 Vac (+10/-15%), 50/60 Hz (±10%).
EC7890: 220-240 Vac (+10%/-15%), 50/60 Hz (±10%).
Power Dissipation: 10W maximum.
Maximum Total Connected Load: 2000 VA.
Fusing Total Connected Load: 15A maximum, type SC or equivalent, fast blow.

Environmental Ratings:
Ambient Temperature:
Operating: -40°F to +140°F (-40°C to +60°C).
Storage: -40°F to +150°F (-40°C to +66°C).
Humidity: 85% relative humidity continuous, noncondensing.
Vibration: 0.5G environment.

SIL 3 Capable
SIL 3 Capable in a properly designed Safety Instrumented System. See form number 65-0312 for Certificate Agreement.
Approvals:

systems

NOTE: RM7890A1064, RM7890B1055, RM7890A2064
and RM7890B2055 are rated cULus and CE.

INSTALLATION

WARNING
Fire or Explosion Hazard.
Can cause property damage, serious injury, or
death.
To prevent possible hazardous burner operation,
verify safety requirements each time a control is
installed on a burner.

WARNING
Electrical Shock Hazard.
Can cause personal injury, death or equipment
damage.
Disconnect the power supply before beginning
installation.

When Installing this Product...
1. Read these instructions carefully. Failure to follow
them could damage the product or cause a
hazardous condition.
2. Check the ratings given in the instructions and
marked on the product to make sure the product is
suitable for the application.

3. Installer must be a trained, experienced, flame
safeguard service technician.
4. After installation is complete, check out the product
operation as provided in these instructions.

IMPORTANT
1. Wiring connections for the relay modules are unique;
refer to Fig. 2 or the appropriate Specifications for indi-
vidual subbase wiring.
2. Wiring must comply with all applicable codes,
ordinances and regulations.
3. Wiring must comply with NEC Class 1 (Line Voltage)
wiring.
4. Loads connected to the RM/EC7890 must not exceed
those listed on the RM/EC7890 label or the Specifica-
tions; see Tables 3, 4, and 5.
5. Limits and interlocks must be rated to simultaneously
carry and break current to the ignition transformer,
pilot valve, and main fuel valve(s).
6. All external timers must be listed or component-
recognized by authorities who have proper jurisdiction.
7. For on-off gas-fired systems, some authorities who
have jurisdiction prohibit the wiring of any limit or
operating contacts in series between the flame
safeguard control and the main fuel valve(s).
8. Two flame detectors can be connected in parallel with
the following exceptions:
• C7927 Ultraviolet Detector
• C7915 Infrared Detector
9. This equipment generates, uses and can radiate radio
frequency energy and, if not installed and used in
accordance with the instructions, can cause
interference with radio communications. It has been
tested and found to comply with the limits for a Class B
computing device of Part 15 of FCC rules which are
designed to provide reasonable protection against
such interference when operated in a commercial
environment. Operation of this equipment in a
residential area can cause interference, in which case,
the users, at their own expense, may be required to take
whatever measures are required to correct this
interference.
10. This digital apparatus does not exceed the Class B lim-
its for radio noise for digital apparatus set out in the
Radio Interference Regulations of the Canadian
Department of Communications.

Location

Humidity
Install the relay module where the relative humidity never
reaches the saturation point. The relay module is designed
to operate in a maximum 85% relative humidity
continuous, noncondensing, moisture environment.
Condensing moisture can cause a safety shutdown.

Vibration
Do not install the relay module where it can be subjected
to vibration in excess of 0.5G continuous maximum
vibration.

Weather
The relay module is not designed to be weather tight.
When installed outdoors, protect the relay module in an
approved weather-tight enclosure.
Mounting Wiring Subbase

1. Mount the subbase in any position except horizontally with the bifurcated contacts pointing down. The standard vertical position is recommended. Any other position decreases the maximum ambient temperature rating.

2. Select a location on a wall, burner or electrical panel. The Q7800 can be mounted directly in the control cabinet. Be sure to allow adequate clearance for servicing, installation, access or removal of the relay module, Expanded Annunciator, Keyboard Display Module, flame amplifier, flame amplifier signal voltage probes, Run/Test Switch, electrical signal voltage probes and electrical field connections.

3. For surface mounting, use the back of the subbase as a template to mark the four screw locations. Drill the pilot holes.

4. Securely mount the subbase using four no. 6 screws.

Wiring Subbase

NOTE: There are several different subbase models that can be purchased. It is important to note which subbase is compatible with the relay module when purchasing repair or replacement parts.

Series 1000 Subbase

All relay product codes that start with a 1 (example: RM7840G1014/U) can be used with existing subbase Q7800A1005/U. These relays can also be used on the Series 2000 subbase noted below.

Series 2000 Subbase

All relay product codes that start with a 2 (example: RM7840G2014/U) can be used with subbase Q7800A2005/U.

Subbase Compatibility

Any relay module in the 1000 series is fully backward compatible with any subbase already installed in the field (Q7800A1005/U, Q7800B1003/U, Q7800A2005/U, Q7800B2003/U).

Any relay module in the new 2000 series will only be able to be installed on subbase Q7800A2005/U, Q7800B2003/U and will not be backward compatible with any Q7800A1005/U legacy subbases already installed in the field.

IMPORTANT

Make sure to check the relay model number and check the subbase compatibility prior to ordering or attempting a new installation or field upgrade.

If you attempt to place a 2000 series relay on a non-compatible 1000 series subbase, you will receive an error code of 101. This indicates that you must a) change out the subbase to a Q7800A2005/U or b) choose a compatible 1000 series relay module.

Wiring

WARNING

Electrical Shock Hazard. Can cause personal injury or equipment damage. Disconnect the power supply before beginning installation.

1. For proper subbase wiring and sequence chart, refer to Fig. 2.

2. For proper remote wiring of the KDM, refer to the Specifications for the 2-line VDF KDM (65-0090), the 4-line LCD KDM (32-00110) Data ControlBus Module™ (65-0091) or Extension Cable Assembly (65-0131).

3. Disconnect the power supply from the main disconnect before beginning installation to prevent electrical shock and equipment damage. More than one disconnect can be required.

4. All wiring must comply with all applicable electrical codes, ordinances and regulations. Wiring, where required, must comply with NEC, Class 1 (Line Voltage) wiring.

5. Use recommended wire routing of leadwires:
   a. Do not run high voltage ignition transformer wires in the same conduit with the flame detector, Data ControlBus Module™, or Remote Reset Module wiring.
   b. Do not route flame detector, KDM, Data ControlBus Module™, or Remote Reset Module leadwires in conduit with line voltage circuits.
   c. Enclose flame detector leadwires without armor cable in metal cable or conduit.
   d. Follow directions in flame detector, KDM, Data ControlBus Module™, or Remote Reset Module Instructions.

6. For KDM (KDM), because the KDM is powered from a low voltage, energy limited source, it can be mounted outside of a control panel if it is protected from mechanical damage.

NOTE: Use 13 Vdc power supply any time more than one KDM is used.

7. Use maximum wire lengths:
   a. RM/EC7890 leadwires: The maximum leadwire length is 300 feet (91 meters) to terminal inputs (Control, Running/Lockout Interlock).
   b. Flame Detector leadwires: The maximum flame sensor leadwire length is limited by the flame signal strength.
   c. Remote Reset leadwires: The maximum length of wire is 1000 feet (305 meters) to a Remote Reset pushbutton.
   d. Data ControlBus Module™: The maximum Data ControlBus Module™ cable length depends on the number of system modules connected, the noise conditions and the cable used. The maximum length of all Data ControlBus Module™ interconnecting wire is 4000 feet (1219 meters).

8. For recommended wire size and type, see Table 1.
9. The KDM, or Data ControlBus Module™ (for remote mounting) must be wired in a daisy chain configuration, 1(a)-1(a), 2(b)-2(b), 3(c)-3(c). The order of interconnection of all the devices listed above is not important. Be aware that modules on the closest and farthest end of the daisy chain configuration string require a 120 ohm (1/4 watt minimum) resistor termination across terminals 1 and 2 of the electrical connectors for connections over 100 feet (31 meters).

10. For recommended grounding practices, see Table 2.

11. Be sure loads do not exceed the terminal ratings. Refer to the label on the RM/EC7890 or to the terminal ratings in Table 3.

### Table 1. Recommended Wire Sizes and Part Numbers.

<table>
<thead>
<tr>
<th>Application</th>
<th>Recommended Wire Size</th>
<th>Recommended Part Numbers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Line Voltage Terminals</td>
<td>14, 16, or 18 AWG (0.75, 1.5 or 2.5 mm²) copper conductor, 600 volt insulation, moisture-resistant wire.</td>
<td>TTW60C, THW75C, THHN90C.</td>
</tr>
<tr>
<td>Keyboard Display Module KDM</td>
<td>22 AWG (0.34 mm²) two-wire twisted pair with ground, or five-wire.</td>

</table>

a The RM/EC7890 must have an earth ground providing a connection between the subbase and the control panel or the equipment. The earth ground wire must be capable of conducting the current to blow the 15A fuse (or breaker) in event of an internal short circuit. The RM/EC7890 needs a low impedance ground connection to the equipment frame which, in turn, needs a low impedance connection to earth ground. For a ground path to be low impedance at RF frequencies, the connection must be made with minimum length conductors having maximum surface areas. Wide straps or brackets rather than leadwires are preferred. Be careful to verify that mechanically tightened joints along the ground path, such as pipe or conduit threads or surfaces held together with fasteners, are free of nonconductive coatings and are protected against mating surface corrosion.

b 2000 VA maximum connected load to the RM/EC7890 Assembly.

c See Tables 4 and 5 for device load combinations.

d Requires 220-240 to 120 Vac, 10 Va minimum stepdown transformer to drive the shutter. Not applicable for C7061A1020, C7061A1079 or C7061F1003.

Final Wiring Check

1. Check the power supply circuit. The voltage and frequency tolerance must match those of the RM/EC7890. A separate power supply circuit can be required for the RM/EC7890. Add the required disconnect means and overload protection.
2. Check all wiring circuits and complete the Static Checkout in Table 7 before installing the RM/EC7890 on the subbase.
3. Install the relay module.
4. Restore the panel power.

STATIC CHECKOUT

After checking all wiring, perform this checkout before installing the RM/EC7890 on the subbase. These tests verify the Q7800 Wiring Subbase is wired correctly, and the external controllers, limits, interlocks, actuators, valves, transformers, motors and other devices are operating properly.

WARNING
Explosion Hazard.
Can cause serious injury, death or equipment damage.
1. Close all manual fuel shutoff valve(s) before starting these tests.
2. Use extreme care while testing the system. Line voltage is present on most terminal connections when power is on.
3. Open the master switch before installing or removing a jumper on the subbase.
4. Before continuing to the next test, be sure to remove test jumper(s) used in the previous test.
5. Replace all limits and interlocks that are not operating properly. Do not bypass limits and interlocks.

CAUTION
Equipment Damage Hazard.
Can cause equipment damage or equipment failure.
Do not perform a dielectric test with the RM/EC7890 installed. Internal surge protectors break down and conduct a current, causing the RM/EC7890 to fail the dielectric test or possibly destroy the internal lightning and high current protection.

Equipment Recommended

1. Voltmeter (1M ohm/volt minimum sensitivity) set on the 0 to 300 Vac scale.
2. Two jumper wires, No. 14 wire, insulated, 12 in. (304.8 mm) long with insulated alligator clips at both ends. Note that an ammeter can be used in place of a jumper to confirm current draw of loads (ignition, pilot valve and main valve).

General Instructions

1. Perform all applicable tests listed in the Static Checkout, Table 6, in the order listed.
2. Make sure all manual fuel shutoff valves are closed.
3. For each test, open the master switch and install the jumper wires between the subbase wiring terminals listed in the Test Jumpers column.
4. Close the master switch before observing the operation.
5. Read the voltage between the subbase wiring terminals listed in the Voltmeter column.
6. If there is no voltage or the operation is abnormal, check the circuits and external devices as described in the last column.
7. Check all wiring for proper connections, tight terminal screws, and appropriate wire and wiring techniques.
8. Replace all damaged or incorrectly sized wires.
9. Replace faulty controllers, limits, interlocks, actuators, valves, transformers, motors and other devices, as required.
10. Make sure normal operation is obtained for each required test before continuing the checkout.
11. After completing each test, be sure to remove the test jumper(s).

WARNING
Explosion Hazard.
Can cause serious injury or death.
Be sure all manual fuel shutoff valves are closed.

IMPORTANT
Low fuel pressure limits, if used, could be open. Bypass them with jumpers for the remaining static tests (if required).

**FINAL**

⚠️ **CAUTION**

**Equipment Damage Hazard.**

Can cause serious equipment damage.

After completing these tests, open the master switch, remove all test jumpers from the subbase terminals, and remove any bypass jumpers from the low fuel pressure limits to prevent equipment damage.

---

**Fig. 1. Internal block diagram of the RM/EC7890.**
Fig. 2. Wiring subbase and operating sequence chart for RM/EC7890.
Mounting RM/EC7890 Relay Module

1. Mount the RM/EC7890 vertically on the Q7800 Subbase, or mount horizontally with the knife blade terminals pointing down. When mounted on the Q7800A, the RM/EC7890 must be in an electrical enclosure.

2. When mounting in an electrical enclosure, provide adequate clearance for servicing, installation and removal of the RM/EC7890, KDM, flame amplifier, flame amplifier signal voltage probes, electrical signal voltage probes, and electrical connections.
   a. Allow an additional two inches (51 mm) below the RM/EC7890 for flame amplifier mounting.
   b. Allow an optional three-inch (76 mm) minimum to both sides of the RM/EC7890 for electrical signal voltage probes.

3. Make sure no subbase wiring is projecting beyond the terminal blocks. Tuck in wiring against the back of the subbase so it does not interfere with the knife blade terminals or bifurcated contacts.

   **IMPORTANT**
   Install the RM/EC7890 with a plug-in motion rather than a hinge action.

4. Mount the RM/EC7890 by aligning the four L-shaped corner guides and knife blade terminals with the bifurcated contacts on the wiring subbase and securely tightening the two screws without deforming the plastic.

Mounting Other System Components (Fig. 3)

Refer to the applicable specifications for mounting other system components.

---

Fig. 3. RM/EC7890 Relay Module exploded view.
PRINCIPAL TECHNICAL FEATURES

The RM/EC7890 provides all customary flame safeguard functions as well as significant advancements in safety, annunciation, and system diagnostics.

Safety Shutdown (Lockout) Occurs if:

1. INITIATE PERIOD
   a. AC line power errors occurred, see Operation.
   b. Configuration jumpers have been changed (after 200 hours).
   c. Four minute INITIATE period has been exceeded.

2. STANDBY PERIOD
   a. Flame signal is present after 240 seconds.
   b. Ignition/intermittent pilot valve terminal is energized.
   c. Internal system fault occurred.
   d. Main valve terminal is energized.
   e. 3.0 second (2.0 seconds for RM7890A1064/A2064, RM7890B1055/B2055 and EC7890B1028/B2028) Flame Failure Response Time (FFRT) Amplifier is installed and configuration jumper is selected for relight (see Table 3).

3. SAFE START CHECK
   a. Ignition/intermittent pilot valve terminal is energized.
   b. Internal system fault occurred.
   c. Main valve terminal is energized.

4. PILOT FLAME ESTABLISHING PERIOD (PFEP)
   a. Ignition/intermittent pilot valve terminal is not energized.
   b. Internal system fault occurred.
   c. Main valve terminal is energized.
   d. No flame present at end of PFEP.

5. RUN PERIOD
   a. Ignition terminal is energized.
   b. Internal system fault occurred.
   c. Main valve terminal is not energized.
   d. No flame present and configuration jumper is selected for lockout.
   e. Pilot valve terminal is not energized.

When the tolerances are met, the INITIATE sequence restarts. If the condition is not corrected and the hold condition exists for four minutes, the RM/EC7890 locks out. Causes for hold conditions in the INITIATE sequence:
   a. AC line dropout detection.
   b. AC line noise that can prevent a sufficient reading of the line voltage inputs.
   c. Brownouts caused by a low line voltage.

NOTE: If a 3.0 second flame failure response amplifier is installed (2.0 seconds for RM7890A1064/A2064, RM7890B1055/B2055 and EC7890B1028/B2028) and configuration jumper JR2 is intact, the RM/EC7890 locks out. JR2 must be clipped.

STANDBY

The RM/EC7890 is ready to start an operating sequence when the operating control input (terminal 6) recognizes a call for heat. The burner switch, limits, operating limit control and all microcomputer monitored circuits must be in the correct state for the RM/EC7890 to continue into the Safe Start Check.

Normal Start-Up Safe Start Check

The RM/EC7890 verifies that a flame or flame simulating condition does not exist and proceeds into the Ignition Trial. If a flame or flame simulating condition is present, the RM/EC7890 remains in the STANDBY period.

Ignition Trials

a. Pilot Flame Establishing Period (PFEP):
   (1) The pilot valve and ignition transformer, terminals 8 and 10, are energized. The RM/EC7890 has an intermittent pilot valve, terminal 8.
   (2) Flame must be proven by the end of the four- or ten-second PFEP (30 seconds for RM7890A1031/A2031) or a safety shutdown occurs.
   (3) Once flame is proven, the ignition, terminal 10, is de-energized and the main valve, terminal 9, is energized.
   (a)The RM7890B1030/B2030 finishes the 4- or 10-second PFEP before the main valve is energized.
   (b)The RM7890A1064/A2064 and RM7890B1055/B2055 with JR1 intact completes 10 second PFEP, shutting off ignition (Terminal 10) at 6 seconds. When the JR1 clipped these devices complete a 4 second PFEP, shutting off ignition (terminal 10) at 2 seconds.

Run

The RM/EC7890 is now in RUN and remains in RUN until the controller input, terminal 6, opens, indicating that the demand is satisfied or a limit has opened.
SETTINGS AND ADJUSTMENTS

Selectable Site-Configurable Jumpers

The RM/EC7890 has two site-configurable jumper options, see Fig. 4 and Table 7. If necessary, clip the site-configurable jumpers with side cutters and remove the resistors from the relay module.

![Selectable Configuration Jumpers](image)

**Fig. 4. Selectable site-configurable jumpers.**

**SERVICE NOTE**

Clipping and removing a site-configurable jumper enhances the level of safety. If using three-second amplifier, site-configurable jumper JR2 must be clipped and removed. If not removed, an F46 Lockout occurs.

![JR2 Removed from RM7890C](image)

![RM7890A1031/A2031 PFEP is Fixed at 30 Seconds, If JR1 is Intact or Clipped](image)

Table 6. Site-Configurable Jumper Options.

<table>
<thead>
<tr>
<th>Jumper Number</th>
<th>Description</th>
<th>Intact</th>
<th>Clipped&lt;sup&gt;d&lt;/sup&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>JR1&lt;sup&gt;a&lt;/sup&gt;</td>
<td>Pilot Flame Establishing Period (PFEP)</td>
<td>10 seconds&lt;sup&gt;b&lt;/sup&gt;</td>
<td>4 seconds&lt;sup&gt;b&lt;/sup&gt;</td>
</tr>
<tr>
<td>JR2</td>
<td>Flame Failure Action Relight&lt;sup&gt;c&lt;/sup&gt;</td>
<td>Lockout</td>
<td></td>
</tr>
</tbody>
</table>

<sup>a</sup> Not Applicable for RM7890A1031/A2031 (30 second PFEP). JR1 removed.

<sup>b</sup> 30 seconds for RM7890A1031/A2031.

<sup>c</sup> The Relight feature (JR2 intact) requires a 0.8 second FFRT Flame Amplifier. The EC/RM7890 locks out and indicates a Fault 46 if a 3.0 second (2.0 second for RM7890A1031/B2031, RM7890B1055/B2055 and EC7890B1028/B2028) FFRT is used and jumper JR2 is not clipped and removed.

<sup>d</sup> Clipping and removing a site-configurable jumper after 200 hours of operation results in a hard lockout, code 110.

<sup>e</sup> For RM7890A1064/B2064, RM7890B1055/B2055 and EC7890B1028/B2028: Intact—Fixed 10 seconds PFEP, Ignition (terminal 10) shuts off at 6 seconds. Clipped—Fixed 4 seconds PFEP, Ignition (terminal 10) shuts off at 2 seconds.

SAFETY AND SECURITY

Physical device protection

Device shall be accessible to authorized personnel only – Installation on publicly accessible places is not recommended as this could lead to unwanted and potentially unsafe changes to device (wiring, configuration, etc).

It is recommended to lock the device in an enclosed cabinet with access allowed only to approved and trained personnel. Also, it is strongly advised to keep all the wiring of device physically secure.

Physical protection of the device is applied via Run/Test switch label/seal. It is intended to prevent and detect unauthorized access.

Modbus & DDL Interface security

Any conducts critical to device functionality (DDL, Modbus lines etc.) shall be physically protected (installed outside public access) since they could be damaged or tampered-with by unauthorized people, either accidentally or for purpose.

Modbus RS-485 & DDL protocols do not support security features. For DDL interface – only DDL devices shall be connected to the Burner Controller DDL line.
