V4730C/V8730C
1:1 Gas/Air Servo Regulated Gas Valves

FEATURES

- Wide modulation range (14% to 100% of burner load).
- 24 Vac and 120 Vac models.
- Main valve body with two shutoff seats (double block valve).
- Closing time less than one second.
- Mesh screen (strainer) between inlet flange and main body.
- Various pressure tap points available at main body when no additional valves or pressure switches are used.
- DIN 43650 Plug Connector with 36-in. (914 mm) leadwires included.
- Flexible mounting positions of venturi manifold to fan.
- Replaceable pipe flange adapters available.
- Position indication lamp for each valve stage.

APPLICATION

The V4730C/V8730C 1:1 Gas/Air Servo Regulated Gas Valves, with the addition of the Venturi Mixing Unit (VMU) and dc fan, are used for modulating premix appliances such as gas burners, gas boilers, rooftop units, makeup air units and process applications.

NOTE: Photo shows valve with manual safety shutoff valve and venturi installed.
SPECIFICATIONS

The specifications in this section are related to the Venturi Mixing Unit (VMU) and Combination Gas Valve.

</table>

When used with VMU335 Venturi Unit.

Maximum Operating Pressure (UL):
1.45 psi (100 mBar), except for 1-1/4 in. size:
(24V): 1 psi (70 mBar).
(120V): 1.45 psi (100mBar)
CSA Approved: 0.5 psi (34 mBar).

Connections:
1/8 in. (3 mm) NPT pressure taps at inlet and outlet flanges. Eight flange connections are provided at the main body to mount either a pressure switch (high or low) or a Valve Proving System (VPS).

Torsion and Bending Stress:
Pipe connections meet EN151, Group 2, requirements.

Electrical Equipment:
Standard DIN plug connector with 36-in. (914 mm) leadwires.

Valve Position Indicator Lamps:
Inboard (closest to the valve body)—V1. Outboard—V2.

Ambient Temperature Range:
5°F to 140°F (-15°C to +60°C).

Coil Insulation Solenoid Valves:
Class H insulation system.

Body Material:
Aluminum alloy, die-cast.

Strainer:
Fine mesh screen (0.135 in. [0.34 mm] diameter). AISI 303 steel, serviceable after removing inlet flange screws. Meets EN161 requirements for strainers.

Seals and Gaskets:
Hydrocarbon-resistant NBR and Viton rubber types.

Flange Kit:
Consists of one flange with sealing plug, one O-ring and four screws. See Table 2.

NOTE: Valve comes with one kit only.

ORDERING INFORMATION

When purchasing replacement and modernization products from your TRADELINE® wholesaler or distributor, refer to the TRADELINE® Catalog or price sheets for complete ordering number.

If you have additional questions, need further information, or would like to comment on our products or services, please write or phone:
1. Your local Honeywell Automation and Control Products Sales Office (check white pages of your phone directory).
2. Honeywell Customer Care
   1885 Douglas Drive North

Manual Shut-Off Valve Kits:
50002653-001 for use with 1 in. NPT or smaller valves.
50002653-002 for use with 1-1/4 in. NPT valves.

Dimensions:
See Fig. 1 through 5.

Fig. 1. V4730C/V8730C Gas Valves, 1/2 in. (13 mm) and 3/4 in. (19 mm) size, dimensions in in. (mm).

Fig. 2. V4730C/V8730C Gas Valves, 1 in. (25 mm) and 1-1/4 in. (32 mm) size, dimensions in in. (mm).

Opening Time:
Dead time maximum: 1 second.
First valve opening: less than 1 second.
Second valve opening: reaches 50% of the adjustable outlet pressure within 5 seconds.

Maximum Allowable Leakage:
Outerwall: 3 cu. in./hr (50 cm³/h) at test pressure of 0.87 psi (6 mBar) and 7.83 psi (540 mBar).
First Valve: 2.5 cu. in./hr (40 cm³/h) at test pressure of 0.87 psi (6 mBar) and 7.83 psi (540 mBar).
Second Valve: 2.4 cu. in./hr (40 cm³/h) at test pressure of 0.87 psi (6 mBar) and 7.83 psi (540 mBar).

High Pressure Test:
In the OFF condition, the valve will withstand 21.75 psi (1.5 Bar) inlet pressure without damage.

Accessories:
FL020008 Mesh Screen.
Flange Kits (see Table 2).
DIN43650 Connector.
320056653-001 Venturi O-rings/screws.

Operational Voltage Range:
The combination gas valve will function satisfactorily between 85% and 110% of the rated voltage.

Gas Valve Connection to Venturi (Field-Assembled):
Four screws and an O-ring are used to connect the gas valve to the venturi/manual shutoff valve.
The metal tube provided with the venturi must be connected between the venturi and the gas valve regulator.

Fan Connection:
The venturi is connected to the fan using six bolts (obtained separately).
Minimum Load:
The minimum load for which the system can be used is 14-17% of the reference load, which equals a minimum pressure differential of 0.2 in. wc (50 Pa) of the 1:1 venturi/servo regulator gas control.

Approvals:
Gas Appliance Directive 90.396/EEC.

PIN: 0063AT1198.
Low Voltage Directive: 73/23/EEC.
Electromagnetic Compatibility Directive: 89/336/EEC.
CSA: File Number 158151-1227192.
Underwriters Laboratories Inc. (UL): MH18476.

Capacity Curves:
See Fig. 6 through 10.
Fig. 3. Venturi, 150-335 kW, with 1/2 in. to 1 in. gas valves and valve shutoff kit installed, dimensions in in. (mm). See Table 3 for dimensions.

**INSTALLATION**

**When Installing This Product...**
1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. The installer must be a trained, experienced, flame safeguard technician.
4. After installation is complete, check out product operation as provided in these instructions.

**WARNING**

Fire or Explosion Hazard. Can cause severe injury, death or property damage.
1. Turn off the gas supply before beginning installation.
2. Disconnect power to the valve actuator before beginning installation to prevent electrical shock and damage to the equipment.
3. Do not remove the seal over the valve inlet and outlet until ready to connect piping.
4. The valve must be installed so that the arrow on the valve points in the direction of the gas flow, so that gas pressure helps to close the valve.

**Mounting Position**

The valve/venturi is factory-calibrated in the upright position for the most accurate metering of the gas flow. This is with the air flow through the venturi in a horizontal direction and the gas flow into the valve in a horizontal direction. The valve can be mounted up to \( \pm 90 \) degrees from this position without affecting the fuel/air metering at medium and high firing rates (3000 to 5000 rpm of the blower), but at lower firing rates (1000 rpm) the fuel might be reduced up to 10% when the valve is not mounted upright.

To counter this, the low fire gas flow may be carefully field adjusted for non-upright mounting as follows:

1. With the valve in the final mounting position, adjust the venturi fan for the lowest burner firing rate.
2. Remove the slotted cap on the gas regulator using a slotted screwdriver. This will expose the offset adjustment screw (see Fig. 11).
3. Using a TORX® T40 or a 5 mm hex wrench, carefully adjust the low fire gas setting for proper combustion.
4. After proper low fire offset adjustment has been made, reinstall the slotted cap on the regulator.
5. Before commissioning the burner, check for proper lightoff and verify correct fuel/air mix and combustion quality throughout the entire firing range (from lowest to highest fan speeds used).

**Mounting Locations**

The distance between the gas valve and the wall/ground must be a minimum of 11-5/16 in. (30 cm).
Main Gas Connection
1. Take care that dirt does not enter the gas valve during handling.
2. Remove the flanges from the valves.
3. Use new, properly reamed, pipe, free from chips.
4. Apply a moderate amount of good quality pipe dope, resistant to the action of liquefied petroleum (LP) gas, only on the pipe threads.
5. Screw the flanges onto the pipes.
6. Do not thread the pipe too far into the flange. Valve distortion or malfunction can result from excess pipe in the flange.
7. Make sure O-ring sealing surfaces are clean.
8. Using general purpose lithium grease, grease the O-ring.
9. Install the O-ring into the O-ring groove provided on the valve body (one O-ring per groove).
10. Mount the gas valve to the flanges, using the screws removed earlier.
11. Complete the electrical connections as instructed in the Electrical Connections section.

**WARNING**
Fire or Explosion Hazard.
Can cause severe injury, death or property damage.
Perform a soap-and-water solution gas leak test any time work is done on a gas system.

Electrical Connections

**WARNING**
Electrical Shock Hazard.
Can cause severe injury or death.
Disconnect the power supply before beginning wiring to prevent electrical shock. More than one disconnect may be involved.

Wiring
1. Use 14, 16 or 18 AWG copper conductor, 600 volt insulation, moisture-resistant wire for line voltage connections. Recommended wire types are TTW60C, THW75C or THHN90C.
2. Follow the instructions below for wiring the gas valve. See Fig. 12 and 13 for reference.
   a. T1 (yellow) will be L2 (120 Vac or 24 Vac).
   b. T2 (black) will be L1 (120 Vac or 24 Vac) to Valve 1.
   c. T3 (blue) will be L1 (120 Vac or 24 Vac) to Valve 2.
   d. Ground (green) will be earth ground.

**WARNING**
Fire or Explosion Hazard.
Can cause severe injury, death or property damage.
Only fully qualified, experienced, flame safeguard technicians should make adjustments on the valve.

**ADJUSTMENTS AND FINAL CHECKOUT**
The following procedures are related to the adjustments on the main gas valve. For adjustments of the other devices (i.e., pressure switches), refer to the instructions supplied with the applicable device.
Pressure Tap Points (Fig. 14)
The V4730C/V8730C Valves have a number of connection points (1/8 in. [3 mm] NPT plugs) for measuring pressure and/or mounting a pressure switch. The pressure tap points are:

1. Inlet pressure at first SSOV flange tap.
2. Inlet pressure at first SSOV.
3. Outlet pressure at first SSOV.
4. Inlet pressure at second SSOV.
5. Outlet pressure at second SSOV flange tap.

The following pressures can be measured:

1. Inlet pressure—tap on inlet flange (1).
2. Pressure after inlet screen (2).
3. Unregulated intermediate pressure—pressure between the two shutoff seats (P).
4. Regulated intermediate pressure—pressure between the shutoff valves (3).
5. Outlet pressure—tap from flange (4).

The corresponding numbers (2, P, 3) can be found on the side of the valve.

NOTE: To mount the C6097 Pressure Switch, refer to instructions in form number 65-0237, furnished with the switch. The pressure switch can be mounted to 2, P, or 3 on either side of the valve.

Second Valve, Fast Opening
Flow rate is adjusted from 0% to 100% of full rated flow. To adjust the flow rate:

1. Remove the flat, round, blue plastic cap from the cover. Using a 3 mm (7/64 in.) hex wrench, turn the adjustment screw counterclockwise to increase or clockwise to decrease the flow rate.
2. Snap the flat, round, blue plastic cap back onto the cover.

Final Checkout of the Installation
Set the system in operation after any adjustment is completed and observe several complete cycles to ensure that all burner components function correctly.

OPERATION
The V4730C/V8730C are normally closed valves. The valves open when energized and close when power is removed.

WARNING
Explosion and Electrical Shock Hazard. Can cause severe injury, death or property damage.
1. Do not put the system into service until you have satisfactorily completed the Valve Leak Test, all applicable tests described in the Checkout section of the instructions for the flame safeguard control, and any other tests required by the burner manufacturer.
2. All tests must be performed by a trained, experienced, flame safeguard technician.
3. Close all manual fuel shutoff valves immediately if trouble occurs.

After the installation is complete, cycle the valve several times with the manual fuel shutoff valve cock closed. Make sure the valve functions properly. Also, perform the Valve Leak Test before putting the valve into service.

Valve Leak Test (Fig. 15)
This is a test for checking the closure tightness of the gas shutoff valve. It should be performed only by trained, experienced, flame safeguard technicians during the initial startup of the burner system or whenever the valve is replaced. It is recommended that this test should also be included in the scheduled inspection and maintenance procedures. FOR A PERIODIC INSPECTION TEST, FOLLOW STEPS 1, 3, 4, 5, 8, 9, 10, 12, 13, 16, AND 17.

WARNING
Electrical Shock Hazard. Can cause severe injury or death.
Remove the power from the system before beginning the valve leak test to prevent electrical shock. More than one disconnect may be involved.

1. De-energize the control system to make sure no power goes to the valves.
2. Close the upstream manual gas cock (A).
3. Make sure the manual test petcock (F) is closed in the leak test tap assembly.
4. To test the first SSOV, remove the 1/8 in. (3mm) NPT plug from pressure tap point P.
5. Install the leak test tap into pressure tap point P on the valve body.
6. Open the upstream manual gas cock (A) to repressurize the first SSOV.
7. Immerse the 1/4 in. (6 mm) tube vertically 1/2 in. (13 mm) in a jar of water.
8. Slowly open the manual test petcock (F).
9. When the rate of bubbles coming through the water stabilizes, count the number of bubbles appearing during a ten-second period. Each bubble appearing represents a flow rate of 0.001 cfh (28 cch). See Table 4.
11. Remove the leak test tap from the valve body.
12. Using a small amount of pipe sealant on the 1/8 in. (3 mm) NPT plug, reinstall the plug in pressure tap point P.
13. To test the second SSOV, remove the 1/8 in. (3 mm) NPT plug from the flange pressure tap point 4.
14. Install the leak test tap into pressure tap point 4.
15. Close the downstream manual gas cock (E).

16. Immerse the 1/4 in. (6 mm) tube vertically 1/2 in. (13 mm) into a jar of water.
17. Slowly open the manual test petcock (F).
18. When the rate of bubbles coming through the water stabilizes, count the number of bubbles appearing during a ten-second period. Each bubble appearing during a 10-second period represents a flow rate of 0.001 cfh (28 cch). See Table 4.
19. Remove the leak test tap from the valve body.
20. Using a small amount of pipe sealant on the 1/8 in. (3 mm) NPT plug, reinstall the plug in pressure tap point 4.

5. Open the downstream manual gas cock (E).
6. Restore the system to normal operation.

**TROUBLESHOOTING**

**WARNING**

Electrical Shock Hazard.
Can cause severe injury, death or property damage.
Use extreme caution when troubleshooting; line voltage is present.

IMPORTANT
Do not replace the valve until all other sources of trouble are eliminated.

**Troubleshooting Procedure**

If the valve does not open when the thermostat or controller calls for heat:

1. Check for voltage at the valve leadwires or terminal block.
2. If there is no voltage at the valve leadwires or terminal block, make sure:
   a. voltage is connected to the master switch.
   b. master switch is closed and overload protection (circuit breaker, fuse, or similar device) has not opened the power line.
3. If there is still no voltage at the valve leadwires or terminal block, make sure all appropriate contacts in the thermostat or controller, limits and flame safeguard control are closed. If one or more are open, determine the cause(s); correct the trouble and proceed.
4. If there is proper voltage at the valve but the valve still does not open, check for normal gas pressure.
5. If the valve still does not open, replace the valve.

If the valve does not close when one or more of the appropriate contacts in the thermostat, controller, limits or flame safeguard control is open:

1. Make sure the valve is wired in the correct circuit.
2. Open the master switch to remove power from the valve.
3. If the valve closes now, check the wiring for the valve and correct the wiring as necessary.
4. Check for a short in the electrical circuit and repair it as necessary.

**SERVICE INFORMATION**

**WARNING**

Explosion Hazard and Electrical Shock Hazard.
Can cause severe injury, death or property damage.
Turn off gas supply and disconnect all electrical power to the valve before servicing.
IMPORTANT
Only trained, experienced, flame safeguard technicians should attempt to service or repair flame safeguard controls and burner assemblies.

Scheduled Inspection and Maintenance
Set up and follow a schedule for periodic inspection and maintenance, including the burner, all other controls and the valves. It is recommended that the valve leak test in the Checkout section be included in this schedule. Refer to the instructions for the primary safety control(s) for more inspection and maintenance information.

Screen/Strainer Replacement
1. Make sure the gas supply is turned off and all electrical power has been removed.
2. Remove bolts/nuts from flange/valve.
3. Remove flange from gas supply pipe.
4. Remove old screen/strainer.
5. Clean the strainer by using compressed air, or replace the strainer.
6. Install the cleaned strainer or new strainer.
7. Make sure O-ring sealing surface is clean on the flange.
8. Using general purpose lithium grease, grease the O-ring.
9. Apply a moderate amount of good quality pipe dope, resistant to the action of LP gas, only on the pipe threads.
10. Install the O-ring in the O-ring groove provided on the flange/valve body (one O-ring per groove).
11. Screw the flange onto the pipe.
12. Mount the gas valve to the flange, using the bolts and nuts for each flange.
13. Apply power to the valve.
14. Turn on the main gas supply.
15. Complete the valve leak test.
16. Return the valve to service.
