T775A/B/M Series 2000 Electronic Stand-Alone Controllers

PRODUCT DESCRIPTION

The T775 electronic stand-alone controllers are the next generation of commercial and agricultural controls capable of remote sensing of temperature and providing switched and/or proportional outputs to various types of loads.

Five models have analog (modulating) outputs for actuator and motor control, and NEMA-4 weatherproof enclosures are available for wet environments.

IMPORTANT
Each T775A/B/M controller is an operating control, not a limit or safety control. If used in applications requiring safety or limit controls, a separate safety or limit control device is required.

Table 1. T775A/B/M Controller Configurations.

</table>

a All models include a digital input for use with the disable or setback option.

b The modulating (analog) outputs are 4-20 mA, 0-10 Vdc, 2-10 Vdc, or Series 90 selectable.

c Each floating output eliminates two SPDT relays.

d These models can support a high/low modulating limit at Sensor B for temperature control at Sensor A.
Temperature Sensorsa

The controller accepts 1,097 Ohms PTC at 77°F (25°C):
- 50021579-001 – Standard sensor (included with all models except NEMA 4X models)
- T775-SENS-STRAP – Strap on sensor with wiring box
- T775-SENS-WR – Water resistant with 5 foot leads (included with NEMA 4X models)
- T775-SENS-WT – Watertight with 6 foot lead
- T775-SENS-OAT – Outdoor air temperature sensor
- C7031B2005 – 6 inch duct mount with wiring box
- C7031D2003 – 5 inch immersion sensor with wiring box (use immersion well; P/N 50001774-001)
- C7031J2009 – 12 foot duct averaging sensor with wiring box
- C7046D1008 – 8 inch duct probe with mounting flange
- C7100D1001 – 12 inch fast response, duct averaging sensor with flange
- C7130B1009 – Room mount sensor

Accessories

- 107324A – Bulb Holder, duct insertion
- 107408 – Heat Conductive Compound, 4 ounce
- 50001774-001 – Immersion Well, stainless steel 304, 1/2 in. threading.

Product Changes

Below are the changes to T775A/B/M models starting with Series 3 (March 2009). Series 3 can be identified by the sideways 3 after the part number on the device label.

1. Modulating high and low limit now both function in either the heat or the cool mode.
2. MIN ON added.
3. SYNC added.
4. Differential and throttling range increased to 300°F.
5. Setpoint and Enable options added to the DI options.
6. HIDE option added to MOD1 and MOD2 (to hide them on the home screen).

Controller Dimensions

---

a See form 62-0265 - Temperature Sensors for the T775 Series 2000 Stand-alone Controller

---

Fig. 1. T775A/B/M Dimensions in inches (mm).
BEFORE INSTALLATION

Review the “SPECIFICATIONS” on page 35 before installing the controller.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check ratings given in instructions and on the product to ensure the product is suitable for your application.
3. Installer must be a trained, experienced service technician.
4. After installation is complete, check out product operation as provided in these instructions.

INSTALLATION AND SETUP

The following installation procedures are typically performed in the order listed:

1. Mounting — See “MOUNTING” below.
2. Wiring — See “WIRING” on this page.
3. Checkout — See page 11.
5. Scheduling (optional) — See page 30.

Additional topics are:

• Temperature sensor calibration begins on page 11.
• Interface overview begins on page 12.
• Setup (for advanced options) begins on page 17.
• Summary menu begins on page 34.
• Troubleshooting begins on page 34.

MOUNTING

This section describes the mounting procedures for the controller and temperature sensor(s).

Controller Mounting

**IMPORTANT**

Avoid mounting in areas where acid fumes or other deteriorating vapors can attack the metal parts of the controller circuit board, or in areas where escaping gas or other explosive vapors are present.

**IMPORTANT**

The controller must be mounted in a position that allows clearance for wiring, servicing, and removal.

Use a screwdriver to pry out only the knockouts that you will use.

If mounting on DIN rail, be sure to remove the knockouts before mounting. See “Controller Wiring” on page 5 and Fig. 7 on page 6 for recommended knockout usage and locations. If you do not use an opened knockout be sure to cover it.

Mount the controller on any convenient interior location using the four mounting holes provided on the back of the enclosure using #6 or #8 screws (screws are not provided and must be obtained separately). Use controller dimensions in Fig. 1 on page 2 as a guide.

The controller may be mounted in any orientation. However, mounting in the orientation shown in Fig. 1 on page 2 permits proper viewing of the LCD display and use of the keypad.

NEMA 4 Enclosure Mounting

For models with NEMA 4 enclosures, ensure that waterproof wire/conduit fittings are used at the knockouts for all wiring attachments. Refer to Fig. 7 on page 6 for knockout locations.

**IMPORTANT**

For NEMA 4 enclosures, be sure to cover and seal all unused open knockouts.

Temperature Sensor(s) Mounting and Location

Temperature sensors may be located up to 1,000 feet (304 m) from the T775A/B/M controller. Refer to Table 3 on page 11 for calibration guidelines.

The sensors may be mounted on a wall or panel for sensing space temperature, strapped to a pipe or inserted in an immersion well (see Fig. 2) for hot or cold water sensing, or taped to a standard cap or bulb holder for duct air sensing. To prevent moisture or condensation entering the sensor through the lead wire holes, mount the sensor with the lead wires exiting the bottom of the sensor.

**NOTES:**

1. The included sensor is not designed for very wet applications. For immersion applications, an immersion well is used.
2. Heat conductive compound must be used in immersion wells.
3. Refer to the list of temperature sensors on page 2 for this type of installation.

**Fig. 2. Sensor Inserted in Immersion Well.**

**NOTE:** Multiple sensors may be parallel-series wired to sense average temperatures in large spaces. Refer to Fig. 3 on page 4.

WIRING

All wiring must comply with applicable electrical codes and ordinances, or as specified on installation wiring diagrams. Controller wiring is terminated to the screw terminal blocks located inside the device.

The remainder of this section describes the temperature sensor wiring and the T775A/B/M controller wiring.
Wiring Connections Access

To access the wiring connections, remove the two screws on the left side of the enclosure and gently swing open the top. Be careful not to stress the ribbon cables that connect the keypad and LCD display to the controller circuit board.

Temperature Sensor Wiring

⚠️ CAUTION

IMPORTANT

Poor wiring practices can cause erratic readings from the sensor. Avoid the following to ensure proper operation:

- Do not route the temperature sensor wiring with building power wiring.
- Do not locate the temperature sensor wiring next to control contactors.
- Do not locate the temperature sensor wiring near electrical motors.
- Do not locate the temperature sensor wiring near welding equipment.
- Make sure good mechanical connections are made to both the sensor and the controller.
- Do not mount the sensor with the lead wire end pointing up in an area where condensation can occur.

If any of the above conditions cannot be avoided, use shielded cable.

NOTE: Each T775 controller must be wired to its own sensor(s). However, a benefit of the T775 controller’s accuracy is that there is no more than a 2°F (-7°C) differential between any two T775 controllers.

Multiple Parallel Sensors

Multiple sensors can be parallel-series wired to sense average temperatures in large spaces. To maintain control accuracy, the number of sensors to be parallel-series wired must be of the n^2 power (for example, 4, 9, 16, etc.). Refer to Fig. 3.

Temperature Sensor Wire Type and Size

Temperature sensors use standard AWG 18/2 unshielded wire. For cable runs greater than 25 feet or where electrical interference may be a problem, shielded cable is recommended (See Fig. 4).

Refer to "Temperature Sensor Calibration" on page 11 for wire size selection where cable runs are longer than 25 feet.

Fig. 3. Parallel-Series Wiring of Sensors.

Fig. 4. Sensor Wiring — Showing Shielded Cable Connection to Sensor A.
Controller Wiring

**WARNING**
Electrical Shock Hazard. Can cause severe injury, death or property damage.
Disconnect power supply before beginning wiring, or making wiring connections, to prevent electrical shock or equipment damage.

**CAUTION**
Do not use 24 Vac power to power any external loads if 120 Vac or 240 Vac is used to power the T775A/B/M controller.

**CAUTION**
A separate earth ground is required. Equipment damage can result if the earth ground is not connected. See Fig. 5 and Table 2 on page 6.

**CAUTION**
Equipment Damage Hazard. Electrostatic discharge can short equipment circuitry. Ensure that you are properly grounded before handling the unit.

See Fig. 7 on page 6 for locating the appropriate power input, remote sensors input, low voltage, contact closure, and load output terminals.

Access to the terminals can be gained through standard conduit knockouts (A through E in Fig. 7 on page 6) located around the perimeter of the enclosure:
- Knockouts A and B should be used only for sensor and low-voltage wiring.
- Knockouts C, D, and E can be used to gain access to the load relay output terminals and 120/240 Vac power wiring.

Controller Wiring Method

Wire the sensors and outputs, then wire the power connection.

Each terminal can accommodate the following gauges of wire:
- Single wire – from 14 AWG to 22 AWG solid or stranded
- Multiple wires – up to two 22 AWG stranded

For 24, 120, or 240 Vac power connections:
- Single wire – from 14 to 18 AWG solid or stranded

Prepare wiring for the terminal blocks, as follows:
1. Strip 1/2 in. (13 mm) insulation from the conductor.
2. Cut a single wire to 3/16 in. (5 mm). Insert the wire in the required terminal location and tighten the screw.
3. If two or more wires are being inserted into one terminal location, twist the wires together a minimum of three turns before inserting them to ensure proper electrical contact.
4. Cut the twisted end of the wires to 3/16 in. (5 mm) before inserting them into the terminal and tightening the screw.
5. Pull on each wire in all terminals to check for good mechanical connection.

**IMPORTANT**
Poor wiring practices can cause erratic readings from the sensor. To ensure proper operation, ensure that good mechanical connections are made to both the sensor and the controller.

**IMPORTANT**
When wiring the input power, only one source of power can be applied to the T775A/B/M controller (24 Vac or 120 Vac or 240 Vac).
Controller Wiring Details

The wiring connection terminals are shown in Fig. 7 and are described in Table 2.

See Fig. 8 – 22 beginning on page 6 for typical T775A/B/M wiring applications.

Fig. 7. T775A/B/M Terminal and Feature Locations.

NOTE: Refer to Table 1 on page 1 for the specific configuration of sensors and outputs supported by the model you are installing.

NOTE: For NEMA 4 enclosures, use waterproof fittings for wiring/conduit connections at knockouts.

240 Vac 240 240 Vac Power

a For Series 90 connections, you must insert a 340 Ohm resistor across terminals R and W. Refer to Fig. 19 on page 9. The resistor is included with the controller.

b A separate earth ground is required for all installations regardless of the power source (24, 120, or 240 Vac). Refer to Fig. 5 on page 5.

WIRING APPLICATIONS (EXAMPLES)

Fig. 8 – 22 illustrate typical controller wiring for various applications.

NOTE: The electronic Series 90 output provided with modulating T775 models can not drive electro-mechanical slidewire devices like older Series 3 modulating meters (prior to Series 6), V9055s, and S984s.

Fig. 19. Wiring for Series 90 Modutrol Motor Control

Fig. 20. Wiring for Changeover Relay and Minimum Position Potentiometer Used with Series 90 Modutrol Motors.
POWER SUPPLY. PROVIDE DISCONNECT MEANS AND OVERLOAD PROTECTION AS REQUIRED.

USE A 1300 OHM RESISTOR FOR TWO MOTORS, 910 OHM RESISTOR FOR THREE MOTORS. THE 407EAU RESISTOR KIT, WHICH IS SHIPPED WITH THE M9184 AND M9185 MOTORS, INCLUDES BOTH RESISTORS.

INSERT 340 OHM RESISTOR (INCLUDED) ACROSS TERMINALS R AND W.

Fig. 21. Wiring for Three Series 90 Modutrol Motors

POWER SUPPLY. PROVIDE DISCONNECT MEANS AND OVERLOAD PROTECTION AS REQUIRED.

UP TO SIX SIMILAR MOTORS CAN BE CONNECTED IN UNISON.

USE RESISTOR BETWEEN R AND B ON THE MOD 1 TERMINAL: 1300 OHMS FOR TWO MOTORS; 910 OHMS FOR THREE MOTORS (4074EAU KIT).

IF COMMON TRANSFORMER IS USED, ALL MOTORS MUST BE IN PHASE. CONNECT THE SAME TRANSFORMER LEAD TO T1 ON EACH MOTOR, CONNECT THE OTHER TRANSFORMER LEAD TO T2 ON EACH MOTOR.

USE TEMPERATURE CONTROLLER SUCH AS H205 OR H705, OR T675A FOR CHANGEOVER CONTROL.

AUTHORITY OF MINIMUM POSITION POTentiOMETER, IF USED, INCREASES WITH THE NUMBER OF MOTORS IN PARALLEL. WITH ONE MOTOR, 50% STROKE; WITH TWO MOTORS, 100% STROKE; WITH THREE MOTORS, 100% STROKE WITH 1/3 OF FULL POTENTIOMETER ROTATION.

REVERSING THE B AND W TERMINALS ON ONE OR MORE MOTORS WILL NOT AFFECT CONTROL PERFORMANCE ON THE OTHER MOTORS.

THE SYSTEM CAN BE CONFIGURED TO HAVE SOME MOTORS BE REVERSE ACTING AND OTHER MOTORS BE DIRECT ACTING.

USE SEPARATE TRANSFORMER FOR T775 WHEN POWERING FROM 24 VAC.

THE SYSTEM IS SHOWN CONNECTED FOR COOLING. FOR HEATING, REVERSE THE W AND B LEADS OF THE MODULATING OUTPUT ON THE T775 CONTROLLER.

Fig. 22. Wiring for Unison Control of M9184 or M9185 Modutrol IV Motor Using One Minimum Position Potentiometer for All Motors.
CHECKOUT

Inspect all wiring connections at the controller terminals, and verify compliance with the installation wiring diagrams.

**WARNING**

Electrical Shock Hazard. Can cause severe injury, death or property damage.

Disconnect power supply before beginning wiring or making wiring connections, to prevent electrical shock or equipment damage.

If any wiring changes are required, first be sure to remove power from the controller before starting work. Pay particular attention to verifying the power connection (24, 120, or 240 Vac).

After the controller is installed and wired, apply power.

**Power Loss**

The date and time settings are retained for 24 hours after a power outage. After a power loss of more than 24 hours, the date and time settings may need to be reentered. All other settings are stored permanently.

**Temperature Sensor Calibration**

As wire length increases, resistance increases and thus the temperature reading increases. If necessary, calibrate the sensor input by reducing the value by the amount shown in the Table 3. For example, a wire run with 18 gauge wire of 1,000 feet, requires a calibration offset of -6.0°F (-21°C).

**IMPORTANT**

If the calibration value in the table exceeds the controller's calibration limits of +/-10°F (+/-6°C), you must use a heavier gauge wire.

For example, with a wire run of 1,000 feet you must use 20 AWG wire or heavier in order to calibrate for wire loss within the limits of the controller.

See “2.2.2.2. CALIBRATE (the sensor)” on page 18 for the instructions to enter the calibration value.

---

---

### Fig. 23. Sensor Resistance vs. Temperature.

**Fig. 23 shows how sensor resistance varies with temperature for a sensor having a positive temperature coefficient (PTC) of 2.1 Ohms per degree F (3.85 Ohms per degree C)**
The T775A/B/M controllers use an LCD panel and 6-button keypad to provide status information and permit user input of the programming, setup, and scheduling parameters.

The following figure describes the display areas of the LCD and the keypad.

Fig. 24. LCD Display - Home Screen And Keypad.

Menu Area – On the home screen, the LCD displays the configured relays and whether they are active. In Program, Setup or Schedule mode, the LCD displays the current menu selection and its order within the menu hierarchy.

Data Area – On the home screen, the LCD displays the sensors and outputs status. In Setup or Program mode, the LCD displays menu choices, parameter selections, and data values.

Lock Icon – The icon indicates the MENU button is locked and prevents access to the Setup and Program menus.

NOTE: Pressing and holding the HOME and MENU buttons simultaneously for five seconds locks/unlocks the MENU button.

6-Button Keypad – The keypad is used to access the menus and enter values (See “Using the LCD Panel Interface”).

Using the LCD Panel Interface

The 6-button keypad is used to move through the menus and enter or change parameter values.

Home Button

Pressing the HOME button at any time exits the current Programming or Setup display screen and returns to the home screen as shown in Fig. 24 and Fig. 25.
IMPORTANT
After four minutes of inactivity (no buttons pressed), the LCD display reverts to the home screen display.

Accessing the Menus

Menus are used for programming, scheduling, viewing the summary settings, and setup of advanced options.

Programming, Scheduling, and Summary Menus

To access these menus from the home screen, press the MENU button (See Fig. 26).

Using the Menus

When you are working with the menus, use the:

- Left arrow button (↓) to scroll backward through the menus
- Right arrow button (↑) to select the highlighted menu item and display its content
- Up and Down arrow buttons (↑ and ↓) to scroll up and down through a list of items or to increase or decrease the value of a displayed parameter

NOTE: If you press the HOME button or there is no keypad activity for four minutes, you exit Program mode and return to the home screen.

If you press the MENU button, you exit and return to the menu.
1. PROGRAMMING

The controller must be programmed before being placed into service.

IMPORTANT

During programming, the controller is live at all times. For example, the contacts may open and close when adjusting the setpoint.

The Programming process uses a hierarchical menu structure that is easy to use. You press the ▼ and ▲ arrow buttons to move forward and backward through the menus.

NOTES:
1. The controller interface is intuitive. You may find that you do not need the following procedure instructions to program the controller. You may want to use this procedure simply as a reference to locate the particular option or parameter of interest.
2. The menus can display only those relays that are defined in Setup (See “2.3.2. NBR OF RELAYS” on page 24). For example, if you configure only two relays, then only two relays display on the appropriate menus.
3. If you press the HOME button or there is no keypad activity for four minutes, you exit Program mode and return to the home screen.
4. If you press the MENU button, you exit Program mode and return to the menu.

Setpoint and Differential

The following describes the relationship between setpoint and differential for heating and cooling. These settings are programmed for each output relay.

Heating Mode Setpoint and Differential

In heating mode, the differential is below the setpoint. The relay de-energizes when the temperature rises to the setpoint. As the temperature drops to the setpoint minus the differential, the relay energizes.

Cooling Mode Setpoint and Differential

In cooling mode, the differential is above the setpoint. The relay de-energizes when the temperature falls to the setpoint. As the temperature rises to the setpoint plus the differential, the relay energizes.

Setpoint High Limit

You can set a single irreversible setpoint high limit maximum value, which is applied to all outputs.

Adjust the setpoint (at any output) to the desired maximum setpoint. Then, simultaneously press the home, ▼, and ▲ buttons and continue to press all three buttons for five seconds to set the setpoint high limit maximum to this value.

NOTE: You must press all three buttons at exactly the same time for this action to occur.

IMPORTANT

1. This action sets the maximum setpoint value of all outputs to the setpoint high limit maximum.
2. Setting the high limit setpoint maximum is irreversible. If you perform the action inadvertently gently and this setpoint adversely affects the control of your system, you must replace the controller.

Programming the T775A/B/M Controller

To program the controller, perform the following procedures in the order listed:

1. Enter Program mode — see “1.1. Entering Program Mode”
2. Program the Outputs — see “1.2. Program Menu for Outputs”

When programming is complete, you may continue with “3. SCHEDULING” on page 30 or, for advanced options, continue with “2. SETUP (ADVANCED OPTIONS)” on page 17.

1.1. Entering Program Mode

Press the MENU button, then select PROGRAM and press the ▲ button to view the Program menu.

Fig. 28 shows the Program menus for controllers with and without Modulating Outputs.

NOTE: Modulating outputs are not available on the T775A and T775B controller models.
1.2. Program Menu for Outputs

Press the **MENU** button, select PROGRAM, then select RELAY 1 (or MOD 1) to view the parameters. Fig. 29 shows RELAY 1.

**NOTE:** For MOD 1 and 2, THROT RNG replaces DIFFRNTL.

**NOTE:** The Setback parameter displays only if scheduling is enabled (See Fig. 57 on page 24) or the DI Option is set to Setback. (See Fig. 60 on page 25).

Continue with “1.2.1. SETPOINT”.

---

### 1.2.1. SETPOINT

1. From the menu, use the ↑ and ↓ buttons to highlight SETPOINT.
2. Press the ► button to display the setpoint value.
3. Use the ↑ and ↓ buttons to increase/decrease the desired setpoint temperature.
   - Default: 70° F (21° C)
   - Range: -40° to 248° F (-40° to 120° C)
4. Press the ► button to accept the setpoint temperature and display the next option.

---

In heating mode, the Differential is below the setpoint. The relay de-energizes when the temperature rises to the setpoint. As the temperature drops to the setpoint minus the Differential, the relay energizes.

In cooling mode, the Differential is above the setpoint. The relay de-energizes when the temperature falls to the setpoint. As the temperature rises to the setpoint plus the Differential, the relay energizes.

The Throttling Range brackets the setpoint setting, e.g., if the setpoint is 72°F (22° C) and the throttling range is 10°F (-12° C), then the effective throttling temperature range is 62°F to 77°F (19° to 25° C). This applies to both modulating outputs and floating outputs.
1.2.3. SENSOR

1. From the menu, use the ▲ and ▼ buttons to highlight SENSOR.
2. Press the ◄ button to display the sensor selections.
3. Use the ▲ and ▼ buttons to select Sensor A or B.
4. Press the ◄ button to accept the highlighted sensor and display the next option.

Fig. 32. Program - Sensor.

1.2.4. HEAT/COOL

1. From the menu, use the ▲ and ▼ buttons to highlight HEAT/COOL.
   Default: HEAT
2. Press the ◄ button to display the heat and cool selections.
3. Use the ▲ and ▼ buttons to select Heat or Cool.
4. Press the ◄ button to accept the highlighted selection and display the next option.

Fig. 33. Program - Heat/Cool.

1.2.5. SETBACK

The Setback temperature option displays if scheduling is enabled (See Fig. 57 on page 24) or the DI Option is set to Setback. (See Fig. 60 on page 26).

This is the desired setpoint temperature that you want to use during setback mode for this output. For example, if your setpoint is 70°F (21°C) and you want the temperature to drop 10°F during setback mode, enter 60°F (16°C) as the setpoint for this output.

1. From the menu, use the ▲ and ▼ buttons to highlight SETBACK.
2. Use the ▲ and ▼ buttons to increase/decrease the desired setpoint temperature.
   Default: 60°F (16°C)
   Range: -40° to 248°F (-40° to 120°C)
3. Press the ◄ button to accept the value and display the menu.

Fig. 34. Program - Setback.

1.2.6. Program Next Output (Mod or Relay)

For the next output (Mod or Relay), select the desired output from the Program menu (Refer to Fig. 28 on page 14).

Go to “1.2.1. SETPOINT” on page 15 to program the next output.

When you finish programming the outputs, continue with “1.2.7. Exiting Program Mode” on page 17.
1.2.7. Exiting Program Mode
Press the HOME button to leave programming mode and return to the home screen.
This completes the programming procedure.

2. SETUP (ADVANCED OPTIONS)

Setup provides the ability to change the factory default settings for the temperature sensors and outputs, to enable/disable reset control, and to enable/disable scheduling.

NOTE: The controller interface is intuitive. You may find that you do not need the following setup instructions for the sensors and outputs. You may want to use this procedure simply as a reference to locate the particular option or parameter of interest.

NOTES:
1. If you press the HOME button or there is no keypad activity for four minutes, you exit Setup mode and return to the home screen.
2. If you press the MENU button, you exit Setup mode and return to the menu.

Setup Procedure
The Setup process uses a hierarchical menu structure that is easy to use. You press the ▼ and ► arrow buttons to move forward and backward through the menus.

NOTE: The menus can display only those relays that are defined in Setup (see “2.3.2. NBR OF RELAYS” on page 24). For example, if you configure only two relays, then only two relays display on the appropriate menus.

Once in Setup mode, you use the —
• Left arrow button (▼) to scroll backward through the Setup menus
• Right arrow button (►) to select the highlighted menu item and display its content
• Up and Down arrow buttons (▲ and ▼) to scroll up and down through a list of items or to increase or decrease the value of a displayed setup parameter

To change the controller’s sensors and output setup parameters, perform the following procedures in the order listed:
1. Enter Setup mode — see “2.1. Entering Setup Mode”
2. Setup Sensors — see “2.2. Setting up the Sensors”
3. Setup Outputs — see “2.3. Setting up the Outputs” on page 21
4. Exit Setup Mode — see “2.4. EXIT Setup Mode” on page 30

2.1. Entering Setup Mode
To enter Setup mode, press and hold the MENU button for five seconds to display the Setup menu. Refer to Fig. 27 on page 13.

2.2. Setting up the Sensors
1. From the Setup menu, use the ▼ and ▲ buttons to highlight SENSORS.
2. Press the ► button to display the Sensors menu.
2.2.1. Number of SENSORS

The value entered here determines the number of sensors displayed on the home screen.

1. From the Sensors menu, highlight # SENSORS then press the button to display the number of sensors.
2. Use the and buttons to enter the number of sensors (1 or 2).
   Default: 2
3. Press the button to accept the value and display the SENSOR A selection.

2.2.2. SENSOR A

1. From the Sensors menu, highlight SENSOR A.
2. Press the button to display the Sensor A selections.

2.2.2.1. UNITS (° F or ° C)

**IMPORTANT**

This is a global change and affects the unit values for all temperature parameters on all displays.

The UNITS screen displays only for Sensor A.

1. From the Sensor A selections, use the and buttons to highlight UNITS.
2. Press the button to display the temperature units.
3. Use the and buttons to highlight F or C.
   Default: F (Fahrenheit)
4. Press the button to accept the units and return to the Sensor A selections.

2.2.2.2. CALIBRATE (the sensor)

Ensure that the wire size calibration value is within the limits. See “Temperature Sensor Calibration” on page 11.

1. From the Sensor A selections, use the and buttons to highlight CALIBRATE.
2. Press the button to display the calibration degree value.
3. Use the and buttons to increase/decrease the desired calibration degrees.
   Default: 0.0
   Range: +/-10° F (+/-6° C)
4. Press the button to accept the value and return to the Sensor A selections.
2.2.2.3. LABEL (the sensor input)

For a sensor already labeled, the display positions to and highlights that label.

1. From the Sensor A selections, use the \ and \ buttons to highlight LABEL.
2. Press the \ button to display the label list.
3. Use the \ and \ buttons to scroll through list and highlight the desired label. You may need to scroll up or down to view all possible labels.
4. Use the \ button to accept the highlighted label and exit the list.

NOTE: The label names in list order are: Sensor, Boiler, Outdoor, Duct, Dischrg, Chiller, Room, Supply, Return, and Animals.

2.2.2.4. Exit Sensor A Setup

Press the \ button to exit Sensor A selections and return to the Sensors menu.

or

Use the \ and \ buttons to highlight EXIT and press the \ button.

2.2.3. SENSOR B

For the T775M2030 and T775M2048 models only, which have a High/Low modulating temperature limit, the LIMIT item displays on the Sensor B menu.

1. From the Sensors menu, use the \ button to highlight SENSOR B.
2. Press the \ button to display the Sensor B menu.

2.2.3.1. CALIBRATE

Setting the calibration value is accomplished the same way as the Sensor A. See “2.2.2.2. CALIBRATE (the sensor)” on page 18.

2.2.3.2. LABEL

Setting the label is accomplished the same way as the Sensor A. See “2.2.2.3. LABEL (the sensor input)” on page 19.
2.2.4. LIMIT (Sensor B only)
For the T775M2030 and T775M2048 models only, the LIMIT item displays on the Sensor B menu.

NOTE: The LIMIT option acts only on Modulating Output 1.

1. From the Sensors menu, use the button to highlight SENSOR B.
2. Press the button to display the Sensor B menu.
3. Use the and buttons to select the LIMIT item.
4. Use the button to display the Limit selections.
5. Use the and buttons to select the desired limit, (Disable, Hi Limit, or Low Limit).
   Default: Disable
6. Press the button to accept the value and return to the Sensor B menu.

When you select Hi Limit or Low Limit, the Sensor B menu changes and adds the Hi/Low Limit and Throttling Range items.

If you are setting a Hi or Low Limit, continue with “2.2.4.1. HI LIMIT or LOW LIMIT (Sensor B only)”.

If you selected Disable for the Limit value, continue with “2.3. Setting up the Outputs” on page 21.

2.2.4.1. HI LIMIT or LOW LIMIT (Sensor B only)
Fig. 45 shows the High Limit, but the process is the same for setting the Low Limit.

Sensor B can be assigned a high/low limit, so that as you are controlling temperature at Sensor A, the control adjusts its modulating output to prevent exceeding the user-entered limit for Sensor B.

1. From the Sensor B menu, use the button to highlight HI LIMIT or LOW LIMIT.
2. Press the button display the LIMIT value.
3. Use the and buttons to increase/decrease the desired Limit value.
4. Press the button to accept the value and return to the Limit menu.

The high and low limit action will work in either the heat or the cool mode as follows:
- When the low limit is used in the heat mode, the MOD1 output increases to prevent reaching the low limit at sensor B.
- When the high limit is used in the heat mode, the MOD1 output decreases to prevent reaching the hi limit at sensor B.
- When the low limit is used in the cool mode, the MOD1 output decreases to prevent reaching the low limit at sensor B.
- When the high limit is used in the cool mode, the MOD1 output increases to prevent reaching hi limit at sensor B.
2.2.4.2. THROTTLING RANGE (Sensor B only)

The throttling range for the modulating high or low limit positions the setpoint at the end of the throttling range. For example, with a high limit at Sensor B of 200°F and a throttling range of 10°F, the modulating output controlling Sensor A begins to throttle back at 190°F (88°C), and fully closes at 200°F (93°C). Conversely, the throttling range for the low limit begins above the setpoint in the same manner.

1. From the Limit menu, use the ▼ button to highlight THROT RNG.
2. Use the ▲ and ▼ buttons to increase/decrease the desired value for the Throttling Range. Default = 0
3. Press the ▶ button to accept the value and return to the Limit menu.
4. Press the ◄ button to exit the Limit menu.
5. Press the ◄ button to exit the Sensors menu and return to the Setup menu.

2.3. Setting up the Outputs

1. From the Setup menu, use the ▲ and ▼ buttons to highlight OUTPUTS.
2. Press the ▶ button to display the Outputs menu.

**NOTE:** The menus (e.g. the Outputs menu shown here) can display only those relays that are defined in Setup (see “2.3.2. NBR OF RELAYS” on page 24). For example, if you configure only two relays, then only two relays display on the appropriate menus.

The following procedures set up each modulating output and relay output.

2.3.1. Setting up the Modulating Outputs

1. From the Output menu, use the ▲ and ▼ buttons to highlight the desired modulating output (MOD 1 or MOD 2).
2. Press the ▶ button to display the selected MOD menu.

**NOTE:** Modulating outputs are not available on the T775A and T775B controller models. If you are setting up one of these controllers, skip to “2.3.2. NBR OF RELAYS” on page 24.

Use the remaining procedures, beginning with “2.3.1.1. TYPE (of output signal)” on page 22, to set up each modulating output. If you have two modulating outputs, repeat these procedures for each modulating output.
2.3.1.1. TYPE (of output signal)
1. From the Mod menu, use the ▲ and ▼ buttons to highlight TYPE.
2. Press the ► button to display the Type selections.
3. Use the ▲ and ▼ buttons to highlight the desired output type.
   Default: 4-20 mA
4. Press the ▶ button to accept the selected type and return to the Mod menu.

2.3.1.2. MIN OUT %
The minimum output % prevents the output from dropping below the value entered. This value can be useful to maintain minimum damper position.

Using the time clock or digital input to disable the output forces the output to 0%.

1. From the Mod menu, use the ▲ and ▼ buttons to highlight MIN OUT %.
2. Press the ► button to display the Min Out %.
3. Use the ▲ and ▼ buttons to increase/decrease the desired value from 0% to 100% in 1% increments.
   Default: 0%
   Range: 0 to 100%
4. Press the ▶ button to accept the percentage and return to the Mod menu.

2.3.1.3. INTEGRAL
1. From the Mod menu, use the ▲ and ▼ buttons to highlight INTEGRAL.
2. Press the ► button to display the Integral seconds.
3. Use the ▲ and ▼ buttons to increase/decrease the value from 0 to 3,600 in 10 second increments.
   Default: 400 seconds
   Range: 0 to 3,600 seconds
4. Press the ▶ button to accept the seconds and return to the Mod menu.

NOTES:
1. The Integral time is factory set for 400 seconds. This is a good middle range and should satisfy many applications. The integral time can be increased for applications where sensed response is slow, and can be decreased for applications where sensed response is fast (e.g. discharge air control).
2. As a starting point, an optimal integral time for discharge air typically ranges from 12 to 200 seconds. An optimal integral time for room control typically ranges from 60 to 2,500 seconds. The purpose of integral action is to reduce or eliminate the offset from setpoint during steady state control that is often seen in proportional only control.
3. Keep in mind that control is most sensitive to throttling range. Adjust the throttling range first before any adjustment to integral time. Adjust throttling range to be as wide as possible to start since this will provide the most stable control. Remember that the integral will eliminate the steady state error so you do not need to have a small throttling range to have accurate control. (Integral action allows for controlling to a setpoint even with a wide throttling range).
2.3.1.4. DERIVATIVE

The Derivative default value is factory set to zero (no derivative control). It is strongly recommended that the derivative remain at zero (0) unless you have a very good reason to adjust it. Derivative control is not needed in the vast majority of HVAC applications.

1. From the Mod menu, use the ▲ and ▼ buttons to highlight DERIVATIV.
2. Press the ► button to display the Derivative seconds.
3. Use the ▲ and ▼ buttons to increase/decrease the value.
   Default: 0 (zero)
   Range: 0 to 3,600 seconds
4. Press the ◄ button to accept the seconds and return to the Mod menu.

2.3.1.5. SCHEDULE

The Schedule option displays only if the USE SCHED parameter is set to Yes (See “2.3.3.1. USE SCHED” on page 25).

1. From the Mod menu, use the ▲ and ▼ buttons to highlight SCHEDULE.
2. Use the ▲ and ▼ buttons to highlight YES or NO.
   Default: YES
3. Press the ► button to accept the selection and return to the Mod menu.

Each output can be set up to follow or ignore the built in scheduler. To disable the scheduler for all outputs, see “2.3.3.1. USE SCHED” on page 25.

2.3.1.6. HIDE

The Hide option is used to prevent the MOD 1 and MOD 2 outputs from displaying on the Home screen.

1. From the Mod menu, use the ▲ and ▼ buttons to highlight HIDE.
2. Use the ▲ and ▼ buttons to highlight YES or NO.
   Default: YES
3. Press the ► button to accept the selection and return to the Mod menu.

NOTE: The MOD1 and MOD2 outputs are still active even when hidden from the Home screen.
2.3.1.7. EXIT

Press the  button (or highlight EXIT and press the  button) to exit the Mod menu and return to the Outputs menu.

If you have a second modulating output to configure, go to “2.3.1. Setting up the Modulating Outputs” on page 21.

If you are finished setting up the modulating outputs, continue with “2.3.2. NBR OF RELAYS”.

2.3.2. NBR OF RELAYS

1. From the Outputs menu, use the  and  buttons to highlight # RELAYS.
2. Press the  button to display the number of relays.
3. Use the  and  buttons to display the number from 1 to 4 depending on the model. (See notes below.)
4. Press the  button to accept the value and display the Outputs menu.

NOTES:
1. The T775A/B/M models have the following outputs available:
   - T775A20191 relay output
   - T775B2016up to 2 relay outputs
   - T775B2024up to 4 relay outputs
   - T775B2032up to 2 relay outputs
   - T775B2040up to 4 relay outputs
   - T775M2006no relay outputs
   - T775M2014up to 4 relay outputs
2. The number of relay outputs entered here determines how many relays display on the home screen.

2.3.3. OPTIONS

1. From the Outputs menu, use the  and  buttons to highlight OPTIONS.
2. Press the  button to display the Options menu.
2.3.3.1. USE SCHED

1. Press the ▮ button to display the schedule selections.
2. Use the ▫ and ▮ buttons to highlight YES or NO. Default: NO
3. Press the ▮ button to accept the value and display the MIN OFF option.

Selecting NO disables scheduling for all outputs.

Selecting YES enables scheduling for all outputs. When YES is selected, all individual outputs default to follow the schedule. However, each individual output can be removed from scheduling as desired.

With Scheduling enabled, when you return to Program mode, the new option for Scheduling displays. You can press the home key and then the menu key to view the Schedule options in the menu.

See “2.3.1.5. SCHEDULE” on page 23.

2.3.3.2. MIN OFF or MIN ON

This is the minimum number of seconds of “off time” or “on time” for all relays.

1. Press the ▮ button to display the Min Off/On value.
2. Use the ▫ and ▮ buttons to increase/decrease the desired number of seconds from 0 to 990 seconds in 10 second increments. Default: 0 (zero) Range: 0 to 990 seconds
3. Press the ▮ button to accept the seconds and display the DI OPTIONS.

NOTES:
1. The minimum OFF or ON time applies to all relay outputs.
2. When minimum OFF or ON time is active, relays waiting to be energized display a flashing square underneath the relay number on the home screen.
3. If the minimum OFF time is not equal to zero (0), the minimum OFF time activates at power-up. To manually override, press the ▮ button at any time.
2.3.3.3. DI OPTIONS (digital input options)
The DI Option you select applies to all outputs. This option overrides any Setpoint/Setback values entered in the Schedule.

1. Press the ⬆️ button to display the DI Option selections.
2. Use the ↑️ and ↓️ buttons to highlight DISABLE, SETPOINT, or IGNORE. Default: DISABLE
3. Press the ⬆️ button to accept the value and display the SHOW RT option.

When the digital input (DI) closes, all outputs follow the DI option value (Disable, Setback, or Ignore):
- **DISABLE** disables the outputs; relays return to de-energized state and Mod outputs return to 0% output.
- **SETPOINT** forces the control to the setpoint temperature.
- **SETBACK** enables a setback temperature value to be programmed for each output and forces the control to the setback temperature.
  - To program the Setback temperature, see Fig. 34 on page 16.
- **ENABLE** energizes all relays and MOD outputs to 100%. Use this option carefully.
- **IGNORE** causes the digital input to have no effect on the Relay or Mod outputs.

2.3.3.4. SHOW RT (show run time hours)

1. Press the ⬆️ button to display the Show RT values.
2. Use the ↑️ and ↓️ buttons to select YES or NO. Default: YES
3. Press the ⬆️ button to accept the value and return to the Options menu.

Selecting YES shows the RT (run time) hours for each relay on the home screen displays.

**NOTE:** Run times can be reset to zero for each individual relay. You must do this for each relay that you want to reset to zero. See “2.3.4.3. RESET RT (run time hours)” on page 29.

2.3.3.5. SYNC (synchronize setpoint changes)

1. Press the ⬆️ button to display the Sync values.
2. Use the ↑️ and ↓️ buttons to select YES or NO. Default: NO
3. Press the ⬆️ button to accept the value and return to the Options menu.

Depending on the model, selecting YES causes all setpoints for all relays and MODs to sync to any change to:
- Relay 1 for models without MOD outputs
- MOD1 for models with MOD outputs

For example, assume the MOD1 setpoint is 110°F, MOD2 is 115°F, and Relay 1 is 120°F. With SYNC=YES, when the MOD1 setpoint is adjusted to 112°F (increase 2°F), then MOD2 and all other relay setpoints increase by 2°F. Thus the MOD2 setpoint is now 117°F and the relay 1 setpoint is 122°F.
2.3.3.6. Exit Options Setup

Press the button (or highlight EXIT and press the button) to exit and return to the Outputs menu.

Continue with “2.3.4. Setting up the Relays”

2.3.4. Setting up the Relays

1. From the Outputs menu, use the and buttons to highlight the desired relay (1-4 depending on model).
2. Press the button to display the selected relay menu.

The TYPE selection shown in Fig. 64 displays only for Relay 1 and Relay 3.

Continue with the remainder of section 3.4 to setup the relay outputs.

2.3.4.1. TYPE (standard or floating)

The Floating option is only available on the T775B2016, T775B2024, T775B2032, and T775B2040 models.

For these models, this selection displays only for Relay 1 and/or Relay 3.
1. Press the button to display the Type values.
2. Use the and buttons to select STANDARD OR FLOATING. Default: STANDARD (not floating)
3. Press the button to accept the value and return to the Relay menu.

If you select FLOATING, the relays are paired (1-2 or 3-4) and are setup together. Continue with “2.3.4.1.1. Floating Relay Menu”.

If you select STANDARD, go to “2.3.4.2. SCHEDULE” on page 29.
2.3.4.1.1. Floating Relay Menu

The Floating option is only available on the T775B2016, T775B2024, T775B2032, and T775B2040 models.

When Relay 1 or Relay 3 is setup as floating, relays are paired and the Float 1 or Float 2 menu displays with the selections shown in Fig. 66.

Fig. 66. Setup - Outputs - Floating Relay - Menu.

2.3.4.1.1.1. ACTUATOR (floating relay only)

The Actuator option displays only on the T775B2016, T775B2024, T775B2032, and T775B2040 models when the Type option = Floating.

1. From the menu, use the ▲ and ▼ buttons to highlight ACTUATOR.
2. Press the ► button to display the actuator value.
3. Use the ▲ and ▼ buttons to increase/decrease the desired number of seconds.
   Default: 90 seconds
   Range: 0 to 3,600 seconds
4. Press the ► button to accept the value and display the INTEGRAL option.

The actuator run time is defined as the time needed to move the actuator from the fully closed to fully open position and visa versa.

Fig. 67. Setup - Outputs - Floating Relay - Actuator.

2.3.4.1.1.2. INTEGRAL (modulating/floating relay only)

The Actuator option displays only on the T775B2016, T775B2024, T775B2032, and T775B2040 models when the Type option = Floating.

1. From the menu, use the ▲ and ▼ buttons to highlight INTEGRAL.
2. Press the ► button to display the actuator value.
3. Use the ▲ and ▼ buttons to increase/decrease the desired number of seconds.
   Default: 400 seconds
   Range: 0 to 3,600 seconds
4. Press the ► button to accept the value and display the DERIVATIV option.

See Integral NOTES on page 22 for additional information about setting the Integral time.

Fig. 68. Setup - Outputs - Floating Relay - Integral.
2.3.4.1.3. DERIVATIVE (modulating/floating relay only)

The Derivative option displays only on the T775B2016, T775B2024, T775B2032, and T775B2040 models when the Type option = Floating.

1. From the menu, use the ▲ and ▼ buttons to highlight DERIVATIV.
2. Press the ▶ button to display the actuator value.
3. Use the ▲ and ▼ buttons to increase/decrease the desired number of seconds.
   Default: 0 seconds
   Range: 0 to 3,600 seconds
4. Press the ▶ button to accept the value and display the SCHEDULE option.

Continue with “2.3.4.2. SCHEDULE” for the remaining relay selections.

2.3.4.2. SCHEDULE

This selection displays only if “Use Sched = YES” is selected during the Output Options setup (see “2.3.3.1. USE SCHED” on page 25). When selected, individual outputs default to follow the schedule.

1. Press the ▶ button to display the Schedule values.
2. Use the ▲ and ▼ buttons to select YES or NO.
   Default: YES
3. Press the ▶ button to accept the value and return to the Relay menu.

An individual output can be selected to be controlled or not controlled by the schedule.

If NO is selected, the Setback selection does not appear in the Program menu for this output.

2.3.4.3. RESET RT (run time hours)

This selection displays only if “Show RT = YES” is selected during Output Options setup (see “2.3.3.4. SHOW RT (show run time hours)” on page 26).

1. From the Relay menu, press the ▶ button to display the Reset RT values.
2. Use the ▲ and ▼ buttons to select YES or NO.
   Default: NO
3. Press the ▶ button to accept the value and return to the Relay menu.

Selecting YES immediately resets the output run time hours to zero for this output. When you subsequently return to this screen, the RESET RT defaults to NO.

NOTE: Run times can be reset to zero for each individual relay. You must do this for each relay that you want to reset to zero.
3. SCHEDULING

Scheduling provides the ability to set daily temperature settings for up to two events per day. Typically, these are the daytime (setpoint) and the nighttime (setback) settings.

**IMPORTANT**

To enable Scheduling, you must first enter Setup mode (press and hold the **MENU** button for 5 seconds), select OUTPUTS, select OPTIONS, select USE SCHED, and then select YES. (See “2.3.3.1. USE SCHED” on page 25).

**IMPORTANT**

To properly account for Daylight Saving time, be sure to set the Date before setting the Time. See “3.2.2. SET DATE” on page 31.

**NOTE**: Each output is independently configurable to follow the schedule or not. For modulating outputs, see “2.3.1.5. SCHEDULE” on page 23. For relay outputs, see “2.3.4.2. SCHEDULE” on page 29.

**NOTE**: The controller interface is intuitive. You may find that you do not need the following scheduling instructions. You may want to use this procedure simply as a reference to locate the particular option or parameter of interest.

**NOTES:**

1. If you press the **HOME** button or there is no keypad activity for four minutes, you exit Scheduling mode and return to the home screen.

2. If you press the **MENU** button, you exit Scheduling mode and return to the menu.

To create or change a schedule, you use the —

- **Left arrow button (◄)** to scroll backward through the Schedule menus
- **Right arrow button (►)** to select the highlighted menu item and display its content
- **Up and Down arrow buttons (↑ and ↓)** to scroll up and down through a list of items or to increase or decrease the value of a displayed schedule parameter

**Creating a Schedule**

To create a schedule, perform the following in the order listed:

1. Enable Scheduling in Setup mode - See “2.3.3.1. USE SCHED” on page 25
2. Enter Schedule mode — See “3.1. Entering Schedule Mode”
3. Set the Schedule Options — See “3.2. OPTIONS”
4. Set Individual Schedules — begin with “3.3. Setting Individual Schedules” on page 32
5. Exit Schedule Mode — See “3.4. Exiting Scheduling Mode” on page 33

**3.1. Entering Schedule Mode**

Press the **MENU** button, then select SCHEDULE and press the ► button to view the Schedule menu.
3.2. OPTIONS
1. From the Schedule menu, use the ▲ and ▼ buttons to highlight OPTIONS.
2. Press the ▶ button to display the Options menu.

3.2.1. SET TIME
Setting the system time is required to enable the controller to follow daylight saving time.

**IMPORTANT**
Set the Date before setting the Time. See “3.2.2. SET DATE”.

1. From the Options menu, use the ▲ and ▼ buttons to highlight SET TIME.
2. Press the ▶ button to display the current system time setting.
3. Use the ▶ button to cycle between the hour, minute, and AM/PM values.
4. Use the ▲ and ▼ buttons to increase/decrease the desired value for the hour, minute, and AM/PM.
5. Press the ▶ button to accept the Time and return to the Options menu.

3.2.2. SET DATE
Setting the system date is required to enable the controller to follow daylight saving time.

**IMPORTANT**
To properly account for Daylight Saving time, be sure to set the Date before setting the Time.

1. From the Options menu, use the ▲ and ▼ buttons to highlight SET DATE.
2. Press the ▶ button to display the current system date setting.
3. Use the ▶ button to cycle between the month, day, and year values.
4. Use the ▲ and ▼ buttons to increase/decrease the desired value for the month, day, and year.
5. Press the ▶ button to accept the Date and return to the Options menu.
3.2.3. DAYLIGHT (daylight saving time)

1. From the Options menu, use the ▲ and ▼ buttons to highlight DAYLIGHT.
2. Press the ◀ button to display the current system setting for daylight saving time.
3. Use the ▲ and ▼ buttons to select YES or NO. Default: YES
4. Press the ◀ button to accept the value and return to the Options menu.
5. From the Options menu, use the Use the ▲ and ▼ buttons to highlight EXIT.
6. Press the ◀ button to return to the Schedule menu.

3.3. Setting Individual Schedules

As shown in the Schedule menu (Fig. 73 on page 30), schedules can be set for the following time periods:
- Monday through Friday
- Saturday and Sunday
- Individual days of the week

1. From the Schedule menu, use the ▲ and ▼ buttons to highlight the desired time period.
2. Press the ◀ button to display the Schedule menu for the selected time period.

For each selected time period, the schedule event (E1 and E2) parameters are exactly the same as shown in Fig. 78.

SCHEDULING EXAMPLE

Setting the schedule is independent of the temperature settings for the relay outputs. The following illustrates a weekly schedule for daytime (setpoint) and night time (setback) use and shows the factory default settings:

<table>
<thead>
<tr>
<th>DAY</th>
<th>EVENT</th>
<th>SETPT ACTION</th>
<th>TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mon-Fri</td>
<td>Event 1 (E1)</td>
<td>Setpoint</td>
<td>6:00 AM a</td>
</tr>
<tr>
<td>Mon-Fri</td>
<td>Event 2 (E2)</td>
<td>Setback</td>
<td>6:00 PM b</td>
</tr>
<tr>
<td>Sat-Sun</td>
<td>Not used; remains in Setback from Mon-Fri E2 settings</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a Setpoint time span is 6:00 AM until 5:59 PM because setback starts at 6:00 PM.
b Setback time span is 6:00PM until 5:59 AM because setpoint starts at 6:00 AM.

To set a schedule, continue with “3.3.1. E1 SETPT (setpoint for event 1)”.

The following figures show the MON-FRI menu, but the menu selections are the same for any time period.
3.3.1. E1 SETPT (setpoint for event 1)

1. From the selected time period menu, use the ▲ and ▼ buttons to highlight E1 SETPT.
2. Press the ► button to display the setpoint options.
3. Use the ▲ and ▼ buttons to highlight the desired option.
4. Press the ◄ button to accept the value and return to the selected time period menu.

3.3.2. E1 TIME (time for event 1)

1. From the selected time period menu, use the ▲ and ▼ buttons to highlight E1 TIME.
2. Press the ► button to display the current time setting for event 1.
3. Use the ◄ button to cycle between the hour, minute, and AM/PM values.
4. Use the ▲ and ▼ buttons to increase/decrease the desired value for the hour, minute, and AM/PM.
5. Press the ◄ button to accept the time and return to the selected time period menu.

3.3.3. E2 SETPOINT (setpoint for event 2)

Creating the setpoint for event 2 is accomplished the same way as the first event. See “3.3.1. E1 SETPT (setpoint for event 1)” on page 33.

3.3.4. E2 TIME (time for event 2)

Creating the time for event 2 is accomplished in the same way as the first event. See “3.3.2. E1 TIME (time for event 1)” above.

3.3.5. EXIT (exit from selected time period settings)

After entering the time for event 2, use the ◄ button to exit the schedule time period and return to the Schedule menu (Fig. 73 on page 30) to select a different time period.

When you finish scheduling the time periods, continue with “3.4. Exiting Scheduling Mode”.

3.4. Exiting Scheduling Mode

Press the HOME button to exit the Schedule menu and return to the home screen display.

This completes the Scheduling procedure.
SUMMARY MENU

The Summary menu provides the ability to view the schedule (E1 and E2 times) for each relay for each day of
the week.

NOTE: Scheduling must be enabled for the Summary menu to display. Enabling the schedule is
determined in the Setup process for the Output Options (see “2.3.3.1. USE SCHED” on page 25).

1. Press the MENU button to view the menu.
2. Use the ▲ and ◀ buttons to highlight SUMMARY.
3. Press the ► button to display the Summary settings.
4. Use the ◀ button to scroll forward through each day of the week (Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and Sunday).
5. While viewing a specific day, use the ▲ and ◀ buttons to cycle through the individual relay schedules for that day.

When finished, press the home key to return to the home display screen.

TROUBLESHOOTING

Power Loss

The date and time settings are retained for 24 hours after a power outage. After a power loss of more than 24 hours,
the date and time settings may need to be reentered. All other settings are stored permanently.

Errors and Diagnostics

The controller provides an error message and diagnostic status as described below.

Error Message

There is a two-character error code that displays in response to controller software problems:

EE

EEPROM Failure — The values read back from the EEPROM are not the same as written into the EEPROM. This error cannot be field repaired. Replace the device.

Diagnostic Messages

There are two diagnostic messages that can display in response to sensor problems. The diagnostic codes that can
flash on the display are:

– –

Sensor Open or Shorted — Two dashes display when a sensor (typically temperature) is open or shorted. An open circuit is considered anything greater than 1570 ohms (greater than 300°F), shorted anything less than 770 ohms (less than -73°F). Whichever stages are operating with this sensor cease to control (meaning relays go to OFF and proportional outputs go to zero percent).

This message can also mean that the sensor is programmed, but not physically connected.

-60° or 270° F (-51° or 132° C) Blinking

Temperature Out of Range — The temperature display blinks when the sensed temperature range is
outside of the display range, below -60° F (-51° C) or above 270° F (132° C). The displayed value remains at
that displayed limit and control continues. Controller continues to function unless an open or shorted state is
detected.

Blinking relay status

Relay Minimum Off Time is Active — On the home screen, each relay’s indicator (●) blinks while the
relay’s minimum off time is active.
SPECIFICATIONS

Power: 24, 120, or 240 Vac; 50/60 Hz;
A separate earth ground is required for any power source.

Power Consumption:
• 8 VA maximum at 60 Hz
• 10 VA maximum at 50 Hz

Operating & Storage Temperature Ambient Rating:
• -40° to 125° F (-40° to 52° C) @ 50 Hz
• -40° to 140° F (-40° to 60° C) @ 60 Hz

Relative Humidity: 5% to 95% non-condensing

Relay Contact Output Ratings (N.O. and N.C.):
• 1/2 hp; 9.8 AFL, 58.8 ALR @ 120 Vac
• 1/2 hp; 4.9 AFL, 29.4 ALR @ 240 Vac
• 125 VA pilot duty @ 120/240 Vac
• 10A @ 24 Vac (resistive)

Modulating Outputs:
• 0-10 Vdc; drive a minimum of 2,000 Ohms
• 2-10 Vdc; drive a minimum of 2,000 Ohms
• 4-20 mA; drive a maximum of 600 Ohms
• Electronic Series 90
• Floating

Safety Compliance
UL 60730-1 for US and Canada

FCC Compliance Statement:
This equipment has been tested and found to comply with limits for a Class B digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in residential installations. This equipment generates, uses, and can radiate radio frequency energy, and if not installed and used in accordance with the instructions, may cause harmful interference to radio communications.

However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause interference to radio or television equipment reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
— Reorient or relocate the receiving antenna
— Move the equipment away from the receiver
— Plug the equipment into an outlet on a circuit different from that to which the receiver is connected
— Consult the dealer or an experienced radio/television technician for additional suggestions

You are cautioned that any change or modifications to the equipment not expressly approve by the party responsible for compliance could void your authority to operate such equipment.

This device complies with Part 15 of the FCC Rules. Operation is subjected to the following two conditions 1) this device may not cause harmful interference and 2) this device must accept any interference received, including interference that may cause undesired operation.
