RM7838A
7800 SERIES Relay Modules

APPLICATION

The Honeywell RM7838A is a microprocessor-based integrated on/off burner control for semi-automatically fired gas, oil, or combination fuel single burner applications. The RM7838A Relay Module is intended to replace the Industrial R4138A,B,C and D Flame Safeguard Primary Control, but does not include an override on momentary power interruptions. The RM7838A System consists of a relay module, keyboard display module, subbase, amplifier and purge card. Options include Data ControlBus Module™, remote display mounting, first-out expanded annunciator and Modbus™ communications capable.

Functions provided by the RM7838A include semi-automatic on/off burner sequencing, flame supervision, system status indication, system or self-diagnosis and troubleshooting.

This document provides installation and static checkout instructions. Other applicable publications are:

SPECIFICATIONS

Electrical Ratings, see Table 3:
Voltage and Frequency: 120 Vac (+10/-15%), 50/60 Hz (±10%).

Power Dissipation: 10W maximum.

Maximum Total Connected Load: 2000 VA.

Fusing Total Connected Load: 15A maximum, type SC fast blow or equivalent.

Environmental Ratings:
Ambient Temperatures:
Operating: -40°F to 140°F (-40°C to 60°C).
Storage: -40°F to 150°F (-40°C to 66°C).
Humidity: 85% relative humidity continuous, noncondensing.
Vibration: 0.5G environment.

SIL 3 Capable:
SIL 3 Capable in a properly designed Safety Instrumented System. See form number 65-0312 for Certificate Agreement.

Approvals:
Underwriters Laboratories Inc. Listed: File No. MP268, Guide MCCZ.
Canadian Standards Association Certified: LR9S329-3.
Factory Mutual Approved: Report No. J.I.1V99A.F.
Swiss Re (formerly Industrial Risk Insurers): Acceptable.

INSTALLATION

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and marked on the product to make sure the product is suitable for your application.
3. Installer must be a trained, experienced, flame safeguard technician.
4. After installation is complete, check out the product operation as provided in these instructions.
**WARNING**
Fire or Explosion Hazard. Can cause property damage, severe injury, or death. Verify safety requirements each time a control is installed on a burner.

**CAUTION**
Electrical Shock Hazard. Can cause electrical shock or equipment/control damage. Disconnect the power supply before beginning installation.

**IMPORTANT**
1. Wiring connections for the relay module are unique; refer to Fig. 2 or the correct Specifications for proper subbase wiring and sequence charts.
2. Wiring must comply with all applicable codes, ordinances and regulations.
3. Wiring must comply with NEC Class 1 (Line Voltage) wiring.
4. Loads connected to the RM7838A must not exceed those listed on the RM7838A label or the Specifications; see Table 3.
5. Limits and interlocks must be rated to simultaneously carry and break current to the ignition transformer, pilot valve, and main fuel valves.
6. All external timers must be listed or component-recognized by authorities having proper jurisdiction.
7. For on-off gas-fired systems, some authorities who have jurisdiction prohibit the wiring of any limit or operating contacts in series between the flame safeguard control and the main fuel valve(s).
8. Two flame detectors can be connected in parallel with the exception of Infrared Flame Detectors (C7015, C7915), Ultraviolet Flame Detectors (C7927, C7961) or Visible Light Detector (C7962).
9. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, can cause interference with radio communications. It has been tested and found to comply with the limits for a Class B computing device of Part 15 of FCC rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area can cause interference, in which case, users, at their own expense, may be required to take whatever measures are required to correct this interference.
10. This digital apparatus does not exceed the Class B limits for radio noise for digital apparatus set out in the Radio Interference Regulations of the Canadian Department of Communications.

**LOCATION**

**Humidity**
Install the relay module where the relative humidity never reaches the saturation point. The relay module is designed to operate in a maximum 85% relative humidity continuous, noncondensing, moisture environment. Condensing moisture can cause a safety shutdown.

**Vibration**
Do not install the relay module where it could be subjected to vibration in excess of 0.5G continuous maximum vibration.

**Weather**
The relay module is not designed to be weather tight. When installed outdoors, protect the relay module in an approved weather-tight enclosure.

**Mounting Wiring Subbase**
1. Mount the subbase in any position except horizontally with the bifurcated contacts pointing down. The standard vertical position is recommended. Any other position decreases the maximum ambient temperature rating.
2. Select a location on a wall, burner or electrical panel. The Q7800 can be mounted directly in the control cabinet. Be sure to allow adequate clearance for service, installation, access or removal of the RM7838A, expanded annunciator, keyboard display module, flame amplifier, flame amplifier signal voltage probes, run/test switch, electrical signal voltage probes and electrical field connections.
3. For surface mounting, use the back of the subbase as a template to mark the four screw locations, then drill the pilot holes.
4. Securely mount the subbase using four no. 6 screws (not provided).

**Wiring Subbase**

**CAUTION**
Electrical Hazard. Can cause electrical shock or equipment/control damage. Disconnect the power supply before beginning wiring. More than one disconnect can be required.

1. For proper subbase wiring and sequence chart, see Fig. 2.
2. For proper remote wiring of the keyboard display module, refer to the Specifications for the keyboard display module. (65-0090), Data ControlBus Module™ (65-0091) or extension cable assembly (65-0131).
3. All wiring must comply with all applicable electrical codes, ordinances and regulations. Wiring, where required, must comply with NEC, Class 1 (Line Voltage) wiring.
4. Recommended wire routing of leadwires:
   a. Do not run high voltage ignition transformer wires in the same conduit with the flame detector, Data ControlBus Module™, or remote reset module wiring.
   b. Do not route flame detector, Data ControlBus Module™ or remote reset module leadwires in conduit with line voltage circuits.
   c. Enclose flame detector leadwires without armor cable in metal cable or conduit.
   d. Follow directions in flame detector, Data ControlBus Module™ or remote reset module instructions.
Fig. 1. Internal block diagram of the RM7838A (see Fig. 2 for detailed wiring instructions).

5. For recommended wire size and type, see Table 1.
6. For recommended grounding practices, see Table 2.
7. For keyboard display module (KDM). The KDM is powered from a low voltage, energy-limited source. It can be mounted outside of a control panel if it is protected from mechanical damage.

NOTE: A 13 Vdc power supply must be used any time more than one keyboard display module is used. A maximum of two keyboard display modules or Data ControlBus Modules™ are allowed in any combination.

8. Maximum wire lengths:
a. RM7838A leadwires: The maximum leadwire length is 300 feet (91 meters) to terminal inputs (Control, Running Interlock, High Fire Switch and Low Fire Switch).

b. Flame detector leadwires: The maximum flame sensor leadwire length is limited by the flame signal strength.

c. Remote reset leadwires: The maximum length of wire is 1000 feet (305 meters) to a remote reset pushbutton.

d. Data ControlBus Module™: The maximum Data ControlBus Module™ cable length depends on the number of system modules connected, the noise conditions and the cable used. The maximum length of all Data ControlBus Module™ interconnecting wire is 4000 feet (1219 meters).

9. Be sure loads do not exceed the terminal ratings. Refer to the label on the RM7838A or to the terminal ratings in Table 3.

10. The keyboard display module, Data ControlBus Module™ (for remote mounting or communications) must be wired in a daisy chain configuration, (1(a)-1(a), 2(b)-2(b), 3(c)-3(c)). The order of interconnection of all the devices listed above is not important. Be aware that modules on the closest and farthest end of the daisy chain configuration string require a 120 ohm (1/4 watt minimum) resistor termination across terminals 1 and 2 of the electrical connectors for connections over 100 feet (30.5m).

### Final Wiring Check
1. Check the power supply circuit. The voltage and frequency tolerance must match those of the RM7838A. A separate power supply circuit can be required for the RM7838A. Add the required disconnect means and overload protection.
2. Check all wiring circuits and complete Static Checkout in Table 7 before installing the RM7838A on the subbase.
3. Install all electrical connectors.
4. Restore panel power.

### STATIC CHECKOUT
After checking all wiring, perform this checkout before installing the RM7838A on the subbase. These tests verify that the Q7800 Wiring Subbase is wired correctly and that the external controllers, limits, interlocks, actuators, valves, transformers, motors and other devices are operating properly.
**WARNING**

Explosion Hazard. Can cause explosion, electrical shock or equipment damage.

1. Close all manual fuel shutoff valves before starting these tests.
2. Use extreme care while testing the system. Line voltage is present on most terminal connections when power is on.
3. Open the master switch before installing or removing a jumper on the subbase.
4. Before continuing to the next test, be sure to remove test jumpers used in the previous test.
5. Replace all limits and interlocks that are not operating properly. Do not bypass limits and interlocks.

**CAUTION**

Equipment Damage Hazard. Can cause equipment damage.

Do not perform a dielectric test with the RM7838A installed. Internal surge protectors will break down and conduct a current. This can cause the RM7838A to fail the dielectric test or possibly destroy the internal lightning and high current protection.

**Equipment Recommended**

1. Voltmeter (1M ohm/volt minimum sensitivity) set on the 0 to 300 Vac scale.
2. Two jumper wires, No. 14 wire, insulated, 12 in. (304.8 mm) long with insulated alligator clips at both ends. An ammeter can replace the jumper wire to confirm the amp draw when testing the ignition, pilot valve or main valve.

**General Instructions**

1. Perform all applicable tests listed in Static Checkout, Table 7, in the order listed.
2. Make sure all manual fuel shutoff valves are closed.
3. Raise the setpoint of the operating controller to simulate a call for heat.
4. For each test, open the master switch and install the jumper wires between the subbase wiring terminals listed in the Test Jumpers column.
5. Close the master switch before observing operation.
6. Read the voltage between the subbase wiring terminals listed in the Voltmeter column.
7. If there is no voltage or the operation is abnormal, check the circuits and external devices as described in the last column.
8. Check all wiring for correct connections, tight terminal screws, correct wire and proper wiring techniques.
9. Replace all damaged or incorrectly sized wires.
10. Replace faulty controllers, limits, interlocks, actuators, valves, transformers, motors and other devices as required.
11. Make sure normal operation is obtained for each required test before continuing the checkout.
12. After completing each test, be sure to remove the test jumpers.

**WARNING**

Explosion Hazard. Can cause serious injury or death. Be sure all manual fuel shutoff valves are closed.

Mounting RM7838A Relay Module

1. Mount the RM7838A on the 7800 Subbase vertically, or mount horizontally with the knife blade terminals pointing down. When mounted on the Q7800A, the RM7838A must be in an electrical enclosure.

2. When mounted in an electrical enclosure, provide adequate clearance for servicing, installation and removal of the RM7838A, keyboard display module, flame amplifier, signal probes, electrical signal voltage probes and electrical connections.
   a. Allow an additional two inches (51 mm) below the RM7838A for the flame amplifier mounting.
   b. Allow an optional three-inch (76 mm) minimum to both sides of the RM7838A for electrical signal voltage probes.

3. Make sure no subbase wiring is projecting beyond the terminal blocks. Tuck in wiring against the back of the subbase so it does not interfere with the knife blade terminals or bifurcated contacts.

IMPORTANT

The RM7838A must be installed with a plug-in motion rather than a hinge action.

4. Mount the RM7838A by aligning the four L-shaped corner guides and knife blade terminals with the bifurcated contacts on the wiring subbase and securely tightening the two screws without deforming the plastic.

Mounting Other System Components (Fig. 3)

Refer to the applicable specifications for mounting other system components.

FINAL ALL

⚠️ CAUTION

Equipment Damage Hazard. Can cause equipment damage.

After completing these tests, open the master switch and remove all test jumpers from the subbase terminals. Also remove bypass jumpers from limits if used.
Fig. 2. Wiring subbase and sequence chart for RM7838A Relay Module.
PRINCIPAL TECHNICAL FEATURES

The RM7838A provides all customary flame safeguard functions as well as significant advancements in safety, annunciation, and system diagnostics.

Safety Shutdown (Lockout) Occurs If:

1. INITIATE Period
   a. Purge card is not installed or removed.
   b. Purge card is bad.
   c. Configuration jumper was changed (after 200 hours).
   d. AC line power errors, see Operation.
   e. Four minute INITIATE period is exceeded.

2. STANDBY Period
   a. Flame signal is present after 240 seconds.
   b. Intermittent pilot valve/1st stage oil terminal is energized.
   c. Start Switch terminal energized.
   d. Main valve terminal is energized.
   e. Internal system fault.
   f. Purge card is not installed or removed.
   g. Purge card is bad.
   h. Flame detected during the last two seconds.

3. PURGE Period
   a. Flame signal detected during PURGE.
   b. High fire switch fails to close within four minutes, 15 seconds after the burner switch, limit and interlock string is closed.
   c. Intermittent pilot valve/1st stage oil terminal is energized.
   d. Main valve terminal is energized.
   e. Internal system fault.
   f. Purge card is removed.
   g. Purge card is bad.
   h. Start Switch terminal is energized.

4. PILOT FLAME ESTABLISHING Period (PFEP)
   a. Intermittent pilot valve/1st stage oil terminal is not energized.
   b. No flame is present at end of PFEP.
   c. Internal system fault.
   d. Purge card is not installed or removed.
   e. Purge card is bad.
   f. Main valve terminal is energized.

5. RUN Period
   a. Intermittent pilot valve/1st stage oil terminal is not energized.
   b. Main valve terminal is not energized.
   c. No flame is present.
d. Main valve terminal is de-energized.

OPERATION

Sequence of Operation
The RM7838A has the operating sequence listed below; see Fig. 2. The RM7838A LEDs provide visual indication of the program sequence: POWER, PILOT, FLAME, MAIN and ALARM and are displayed on the Keyboard Display Module.

Initiate
The RM7838A enters the INITIATE sequence when the relay module is initially powered. The RM7838A can also enter the INITIATE sequence if the relay module verifies voltage fluctuations of +10/-15% or frequency fluctuations of ±10% during any part of the operating sequence. The INITIATE sequence lasts for ten seconds unless the voltage or frequency tolerances are not met. When the tolerances are not met, a hold condition is initiated and displayed on the KDM for at least five seconds. When the tolerances are met, the INITIATE sequence restarts. If the condition is not correct and the hold condition exists for four minutes, the RM7838A locks out.

Causes for hold conditions in the INITIATE sequence include:

a. AC line dropout is detected.
b. AC line noise that can prevent a sufficient reading of the line voltage inputs.
c. Brownouts caused by low line voltage.

The alarm, terminal 3, is energized during INITIATE.

Standby
The RM7838A is ready to start an operating sequence. When the Burner Switch is closed, the Blower/Combustion Fan is powered. The Airflow Switch closes and provides power to terminal 7 through any additional limits or interlocks.

After terminal 7 is energized, "Safe Start Check" is displayed on the KDM as the RM7838A transitions from Standby to Purge. During safe start check, the RM 7838A verifies that the flame detection system and all components are not in a flame simulating condition. On applications using a shutter, the shutter is energized to make sure no flame is present.

The alarm, terminal 3, is energized all the time the system is in standby.

Normal Start-Up Purge
Closing the burner control switch energizes the combustion fan and provides power to terminal 7 through all limits and interlocks. Powering terminal 7 with all the microcomputer monitored circuits in the correct state, the relay module begins the PURGE sequence.

Selectable PURGE timing from two seconds to 30 minutes is available for the RM7838A.

PURGE timing begins when the damper motor is manually driven to the High Fire Purge position and the High Fire Switch is energized. Four minutes and 15 seconds are provided to drive the damper to the fully open position. A jumpered or welded High Fire Switch adds a 30 second hold to the beginning of purge timing. When PURGE timing is complete, "PILOT:HOLD:T6 (Start Switch)" is displayed on the KDM.

Ignition Trials
1. Pilot Flame Establishing Period (PFEP):
a. With the damper motor manually driven to the Low Fire position:
   (1) Press the START pushbutton and the ignition transformer is energized with power from terminal 10. Power is also applied to terminal 6 through the Start/Stop Switch internal jumper. The STOP Switch and the Alarm Silencing Switch. The RM7838A then energizes the Intermittent Pilot valve (terminal 8).
   (2) During PFEP, the Low Fire Switch and the START switch must remain closed. If one opens before the flame is proven, the pilot valve shuts off, but the pilot flame establishing timer continues to time.

b. Flame must be proven by the end of the ten-second PFEP (four if configuration JRI jumper is removed) to allow the sequence to continue. If flame is not proven by the end of PFEP, a safety shutdown occurs.

c. With flame proven, terminal 21 outputs line voltage to maintain the input to terminal 6, which allows the Start Switch to be released and the ignition to be shut off.

NOTE: Terminal 10 verifies that the Start Switch is released. If the Start Switch is not released, a shutdown occurs.

2. Alarm LED and terminal 3 are turned off when flame is detected.

Run
1. When the flame is proven, the FLAME LED lights and the ALARM LED turns off. Release the Start push-button and the ignition transformer shuts off. At the end of PFEP, the RM7838A proceeds to the RUN period by energizing the main valve, terminal 9, and the MAIN status LED on the relay module.
2. The firing rate damper motor can now be positioned to maintain the input to terminal 6, which allows the Start Switch to be released and the ignition to be shut off.
3. The RM7838A is in RUN and remains in RUN until the STOP pushbutton is pushed, or a limit opens terminal 7.

4. The alarm, terminal 3, is de-energized during RUN and energized when shutdown occurs.

Keyboard Display Module (KDM)
The Keyboard Display Module (KDM) is provided with the RM7838A Relay Module. The first line of the Vacuum Fluorescent Display (VFD) provides:

2. Timing information (PURGE, PILOT IGN, and MAIN IGN) in minutes and seconds.
3. Hold information (PURGE HOLD:T19).
4. Lockout information (Lockout, Fault Code, Message and Sequence).

The extreme right side of the first line is either blank or shows a small arrow pointing to the second line followed by a two-letter code (DI, Diagnostic Information; Hn, Fault History Information; EA, Expanded Annunciator). When the arrow and two-letter codes are displayed, it indicates the second line is showing a selectable message submenu. The second line displays selectable or pre-emptive messages.

A selectable message supplies information for flame strength, system status indication, system or self-diagnostics and troubleshooting.

A pre-emptive message has parentheses around the message and supplies a detailed message to support the sequence status information. A pre-emptive message can also be a lockout message. A pre-emptive message replaces a selectable message to support the sequence status information. It also replaces a selectable message after 60 seconds or if a lockout message is available.

**SETTINGS AND ADJUSTMENTS**

**Selectable Site-Configurable Jumpers**

The RM7838A has one site-configurable jumper option, see Fig. 4 and Table 6. If necessary, the site configurable jumper should be clipped with side cutters and the resistor removed from the relay module.
